Table S2. Summary of this review

ESRD patients' changes in this review
Delayed recovery to a TOF ratio of 0.9
Decreased clearances of both rocuronium and sugammadex
Increased remaining plasma concentrations of both rocuronium and sugammadex
No changes on the incidence of recurrence of NMB, inadequate recovery of neuromuscular function
Longer retention time of sugammadex-rocuronium complex, but effectively removed through hemodialysis within 24-48 hours after surgery
