-----Supporting Information-----

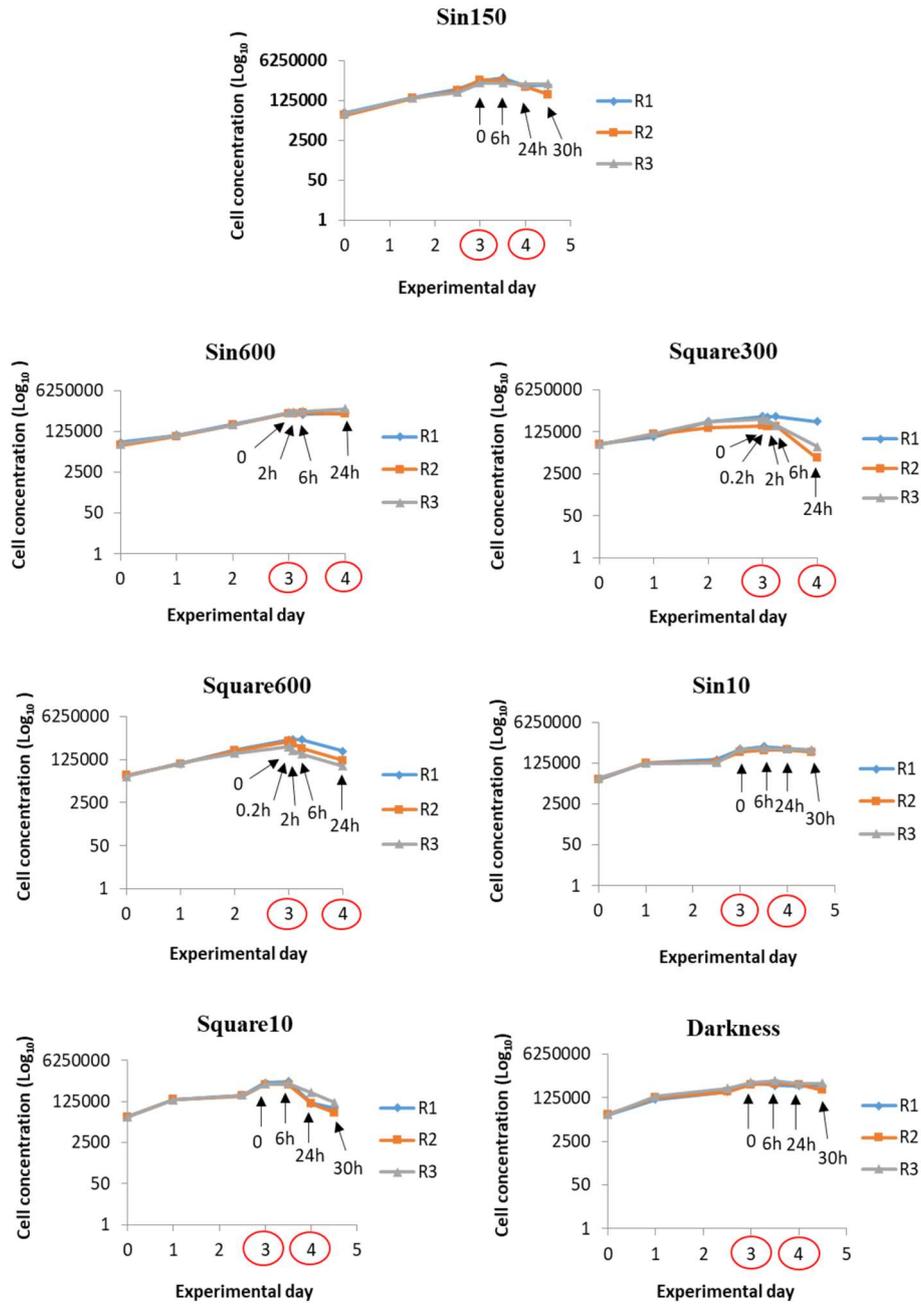

Figure S2. *S. marinoi* growth curves. Growth curves were obtained from three independent cultures (R1, R2, R3). Sampling days are highlighted by red circles and sampling times are reported for each experimental condition: low sinusoidal light with midday peak at 150 $\mu\text{mol photons s}^{-1} \text{m}^{-2}$ (Sin150); high sinusoidal light with midday peak at 600 $\mu\text{mol photons s}^{-1} \text{m}^{-2}$ (Sin600); high square-wave light with midday peak at 300 $\mu\text{mol photons s}^{-1} \text{m}^{-2}$ (Square300); high square-wave light with midday peak at 600 $\mu\text{mol photons s}^{-1} \text{m}^{-2}$ (Square600); very low sinusoidal light with midday peak at 10 $\mu\text{mol photons s}^{-1} \text{m}^{-2}$ (Sin10); very low square-wave light with peak at 10 $\mu\text{mol photons s}^{-1} \text{m}^{-2}$ (Square10); darkness.

Table S1. *S. marinoi* cell growth rates. Growth rates (μ , d⁻¹) at 0 and 24 h from light switch are indicated for each experimental condition as mean \pm SD.

Light condition	0 h	24 h
Sin150	0.93 \pm 0.07	- 0.49 \pm 0.33
Sin600	1.12 \pm 0.07	0.09 \pm 0.21
Square300	0.34 \pm 0.19	- 1.50 \pm 1.40
Square600	0.78 \pm 0.16	- 1.48 \pm 0.42
Sin10	1.09 \pm 0.16	0.09 \pm 0.07
Square10	1.09 \pm 0.05	- 1.53 \pm 0.61
Dark	0.66 \pm 0.13	- 0.14 \pm 0.12

Table S2. Genes analyzed by RT-qPCR. Primer sequences, PCR amplicon sizes, temperature of annealing (Ta), primer efficiencies (E) and correlation factor (R²) are reported.

Gene	Forward primer (5'⇒3')	Reverse primer (5'⇒3')	Amplicon size (bp)	Ta (°C)	E	R ²
