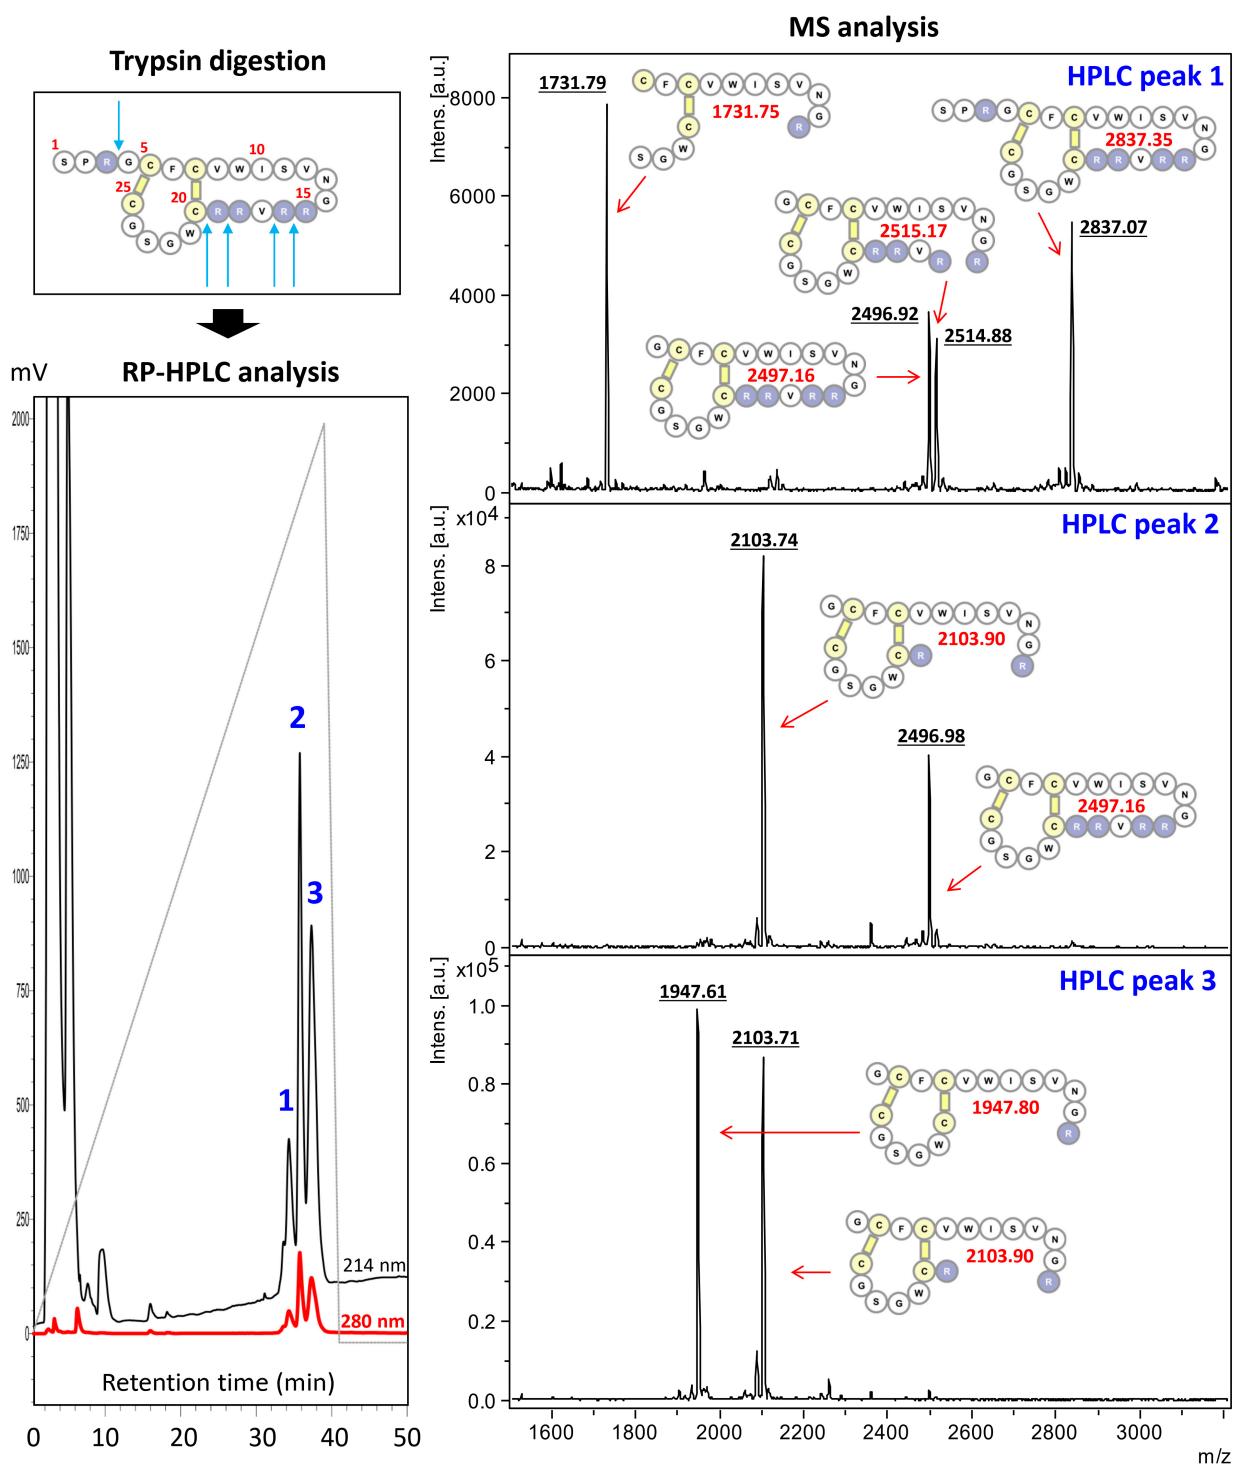

**Figure S1.** Structure analysis of those novel BRICHOS-related peptides from *H. filiformis*. Spatial structures of the peptides were modelled using the AlphaFold algorithm (ColabFold server <https://colab.research.google.com/github/sokrypton/ColabFold/blob/main/AlphaFold2.ipynb>). Accuracy of the predicted structures (predicted local distance difference test (pLDDT)) is not indicated. The top ranked models, according to pLDDT scores, were visualized by the PyMOL software and presented as predicted spatial structures.  $\beta$ -Hairpin motif sequences are marked with bold.

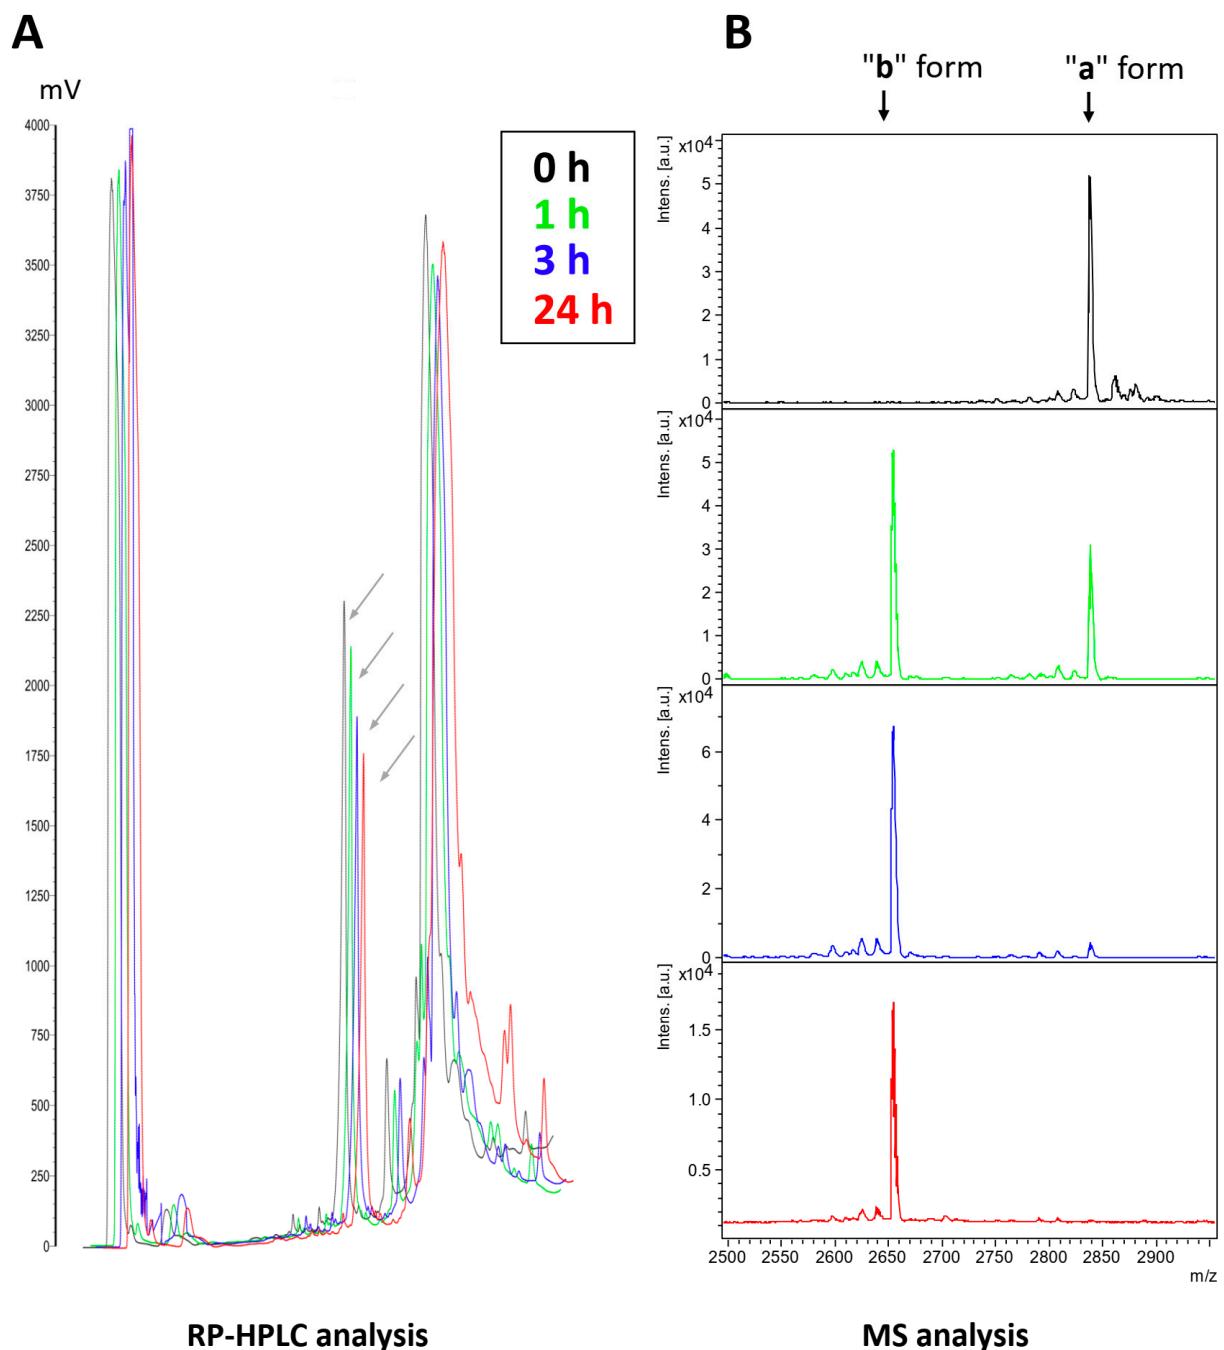

**Figure S2.** MALDI-TOF MS analyses of the obtained peptides HfBRI-25 and HfBRI-28.

**Figure S3.** Accuracy of the predicted structures (pLDDT) for both peptides HfBRI-25 and HfBRI-28.

**Figure S4.** RP-HPLC and MALDI-TOF MS analyses of the tryptic digests of HfBRI-25. The experimentally measured monoisotopic  $[M+H]^+$  values of the major RP-HPLC fractions pointed by the numbers (colored in blue) matched well the corresponding calculated values (colored in red).

**Figure S5.** Stability of HfBRI-25 in serum (RP-HPLC and MS data). **(A)** RP-HPLC profiles (Abs 214 nm) of fractions containing HfBRI-25 and its shortened 23-residue form after 0, 1, 3, and 24 h incubation in 25% buffered human serum. Fractions containing mixed target peptides (HfBRI-25 ("a" form) and its shortened 23-residue "b" form) are marked with grey arrows. **(B)** MALDI-TOF MS analysis of the target RP-HPLC peaks containing HfBRI-25 and its shortened 23-residue form after 0, 1, 3, and 24 h incubation in 25% buffered human serum.

**Table S1.** A list of predicted non-BRICHOS-related AMPs from the *H. filiformis* RNA-seq data
