Supplementary Figure 1. Brain tissue found negative for the presence of aluminium when stained with lumogallion.

Supplementary Figure 1. Representative negative lumogallion staining of white and grey matter of the occipital lobe of a 56-year-old male donor (MS274), diagnosed with RRMS. Lumogallion staining of white (a) and grey (b) matter of the hippocampus produced dull brown fluorescence associated with blood vessels and distinguishable from yellow punctate fluorescence of lipofuscin deposits. Green autofluorescence was observed in adjacent non-stained serial sections (c & d). Upper and lower panels depict magnified inserts of the fluorescence channel and the bright field overlay. Magnification X 400, scale bars: 50 μ m.

Supplementary Tables 1 – 14. Tables include aluminium data ($\mu\text{g/g}$ dry wt.) for all measured tissues for each lobe for each MS donor.
