Multivariable regression models adjusted for child (age, sex), caregiver (education, lifetime adversity, depressive symptoms, caregiver functioning in caregiving role, social support), and early-life child health indicators (birthweight, APGAR score); n/a = not applicable; bolded associations are statistically significant at alpha = 0.05.

Regression models are sequentially adjusted for respective HIV-related factors: viral suppression, timing of ART initiation, current ART regimen. \*\* PI includes Ritonavir, Atazanivar, or Lopinavir/Kaletra; NNRTI = EFV or NVP; NRTI = Abacavir or TDF inclusive. Bolded numbers are statistically significant associations.

**Figure S1.** Peripartum-ART-exposure associated 12 months-averaged difference in functional impairment score from 6–18 years old according to HIV status and developmental stage.
