This document provides some additional XRD patterns for the various ironsand samples used in this investigations. Powder X-ray diffraction (XRD) analyses were carried out on a Bruker D8 diffractometer using Co K α radiation ($\lambda = 1.78901 \text{ \AA}$) and the operation voltage and current were maintained at 40 kV and 35 mA, respectively. Table S1 summarise the main identified structures while Figures S1 to S3 display the measured patterns.

Table S1. Summary of particle size, saturation magnetisation at 1 T, and XRD identification for different ironsand samples in the study.

Sample Name	Max. Particle Size Distribution Peak (μm)	Saturation Magnetization (emu/g @ 1 T)	XRD Identification
18M	255	43.2	Magnetite, Hematite
11M	153	36.1	Magnetite, Hematite
14M	224	44.0	Magnetite, Hematite
19M	290	19.7	Magnetite, Hematite
20M	329	25.5	Magnetite, Hematite
IPT35M	153	46.4	Magnetite, Hematite

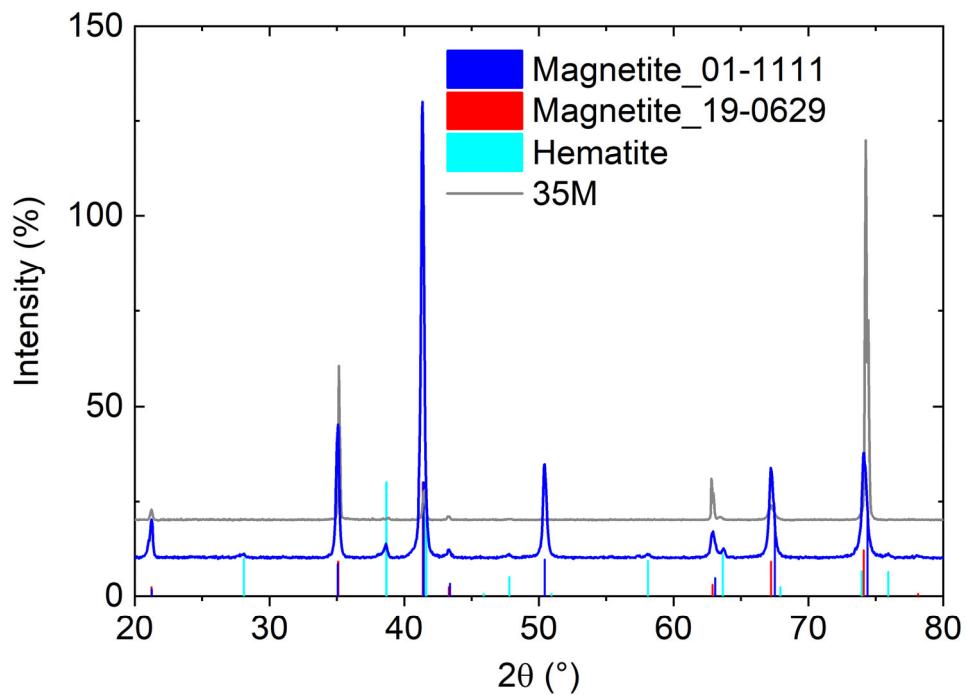

Figure S1. Comparison of the XRD pattern of the 35M sample with the ironsand from previous investigation [1].

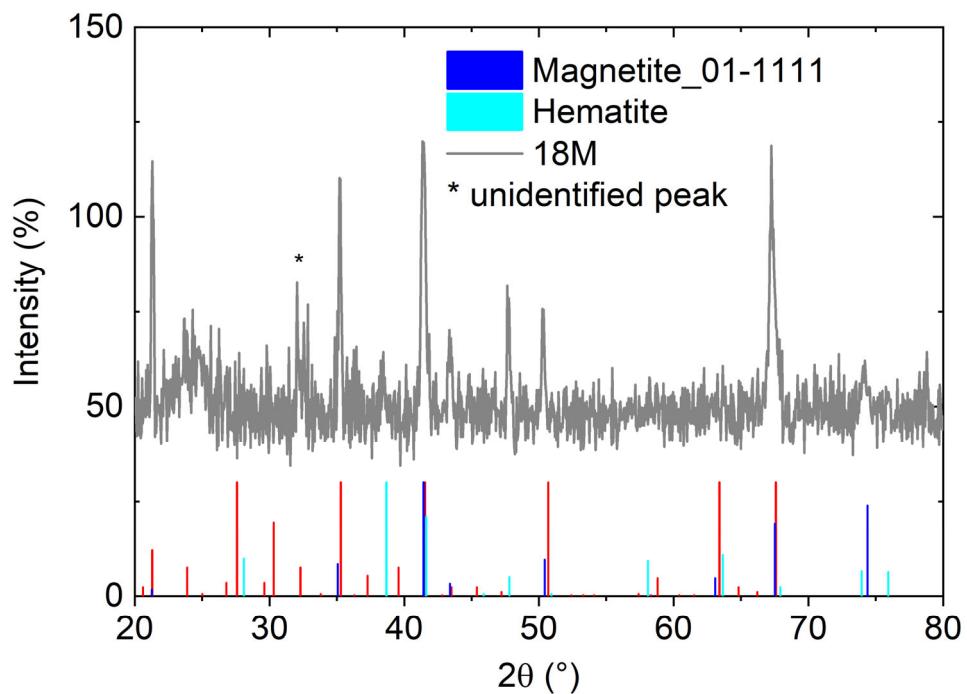

Figure S2. XRD pattern of the 18M samples.

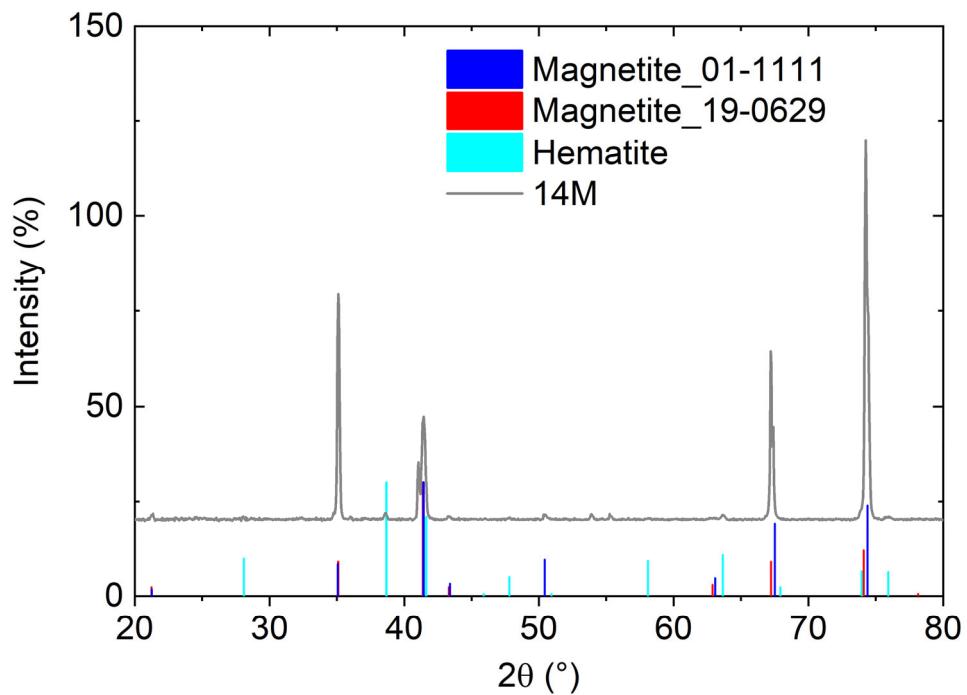

Figure S3. XRD pattern of the 14M samples.
