1. Casting Procedure

For preparation of as-cast Mg substrates, pure Mg ingot (99.9% Mg) was used as starting materials. The materials were melted under argon gas in a mild steel crucible at a temperature of 740 °C for 45 min holding time. Following melting, the molten metal was poured into a pre-heated mild steel mold to attain ingots. The surface morphology of the uncoated specimens, as cast magnesium substrate was observed using optical microscope is shown in Figure S1. It shows the presence of grain boundaries.
