\* Sieve size = 1 × 1 mm<sup>2</sup>; \*\* Buffer material code: JN 108.

**Table S2.** Different buffer materials adapted for the designed window case 13 [45].

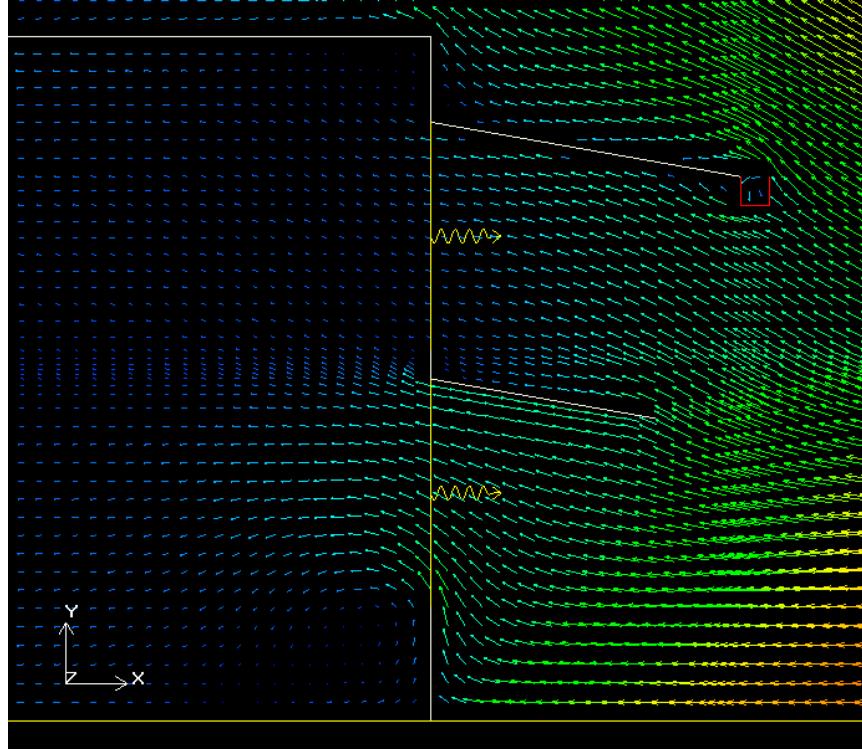

| Case Study | Buffer Material Code | Composition       | File Length (mm) | Example of Usage         |
|------------|----------------------|-------------------|------------------|--------------------------|
| 25         | JN 108               | Nylon             | 8                | Golf course              |
| 26         | JN 110               | Nylon             | 10               |                          |
| 27         | JN 119               | Nylon             | 19               | Outdoor tennis court     |
| 28         | JNG 135              | Polyester + Nylon | 35               | Multipurpose sport field |
| 29         | JE 160               | Polyester         | 60               | Football/baseball field  |

**Figure S5.** Experimental setup of the windows with rainwater gutters and an adjustable screen (case 15). (**Left figure**) The screen is parallel to the windowpane for no rain and causes almost no change in the ventilation efficiency. (**Right figure**) The angle of the screen is adjusted to 45° during the raining period as presented in Figure 6—case 15.

**Figure S6.** Velocity vector in front of the inlet of case 17 (side view) generated using post-production tools in Airpak (display options: mesh points).

**Figure S7.** Velocity vector in front of the inlet of case 19 (side view) generated using post-production tools in Airpak (display options: mesh points).

**Table S3.** Measurement values of the average wind speed on the leeward side of the model and the measurement values of rain penetration for four different wind speeds (3, 5, 7, and 9 m/s) in the sensitivity analysis (Figure 7).

| Case | 3 m/s               |                     | 5 m/s               |                     | 7 m/s               |                     | 9 m/s               |                     |

<s> = simulation (m/s), <m> = measurement (m/s).

**Figure S8.** Sensitivity analysis for different wind profiles (for six representatives of designed windows—cases 1, 5, 12, 13, 17 and 19); Original simulation = uniform wind profile; ABL1 = ABL wind profile generated from urban, suburban, wooded areas; ABL2 = ABL wind profile generated from scattered obstacles on open terrain;  $k^*$  = average turbulent kinetic energy at inlet boundary conditions ( $\text{m}^2/\text{s}^2$ );  $\epsilon^*$  = average rate of dissipation of the turbulent kinetic energy at inlet boundary conditions ( $\text{m}^2/\text{s}^3$ ).
