

Supplementary Figure S1: Effects of 40 μ M β -CBT versus vehicle control treatments on protein level. Western blot showed no significant elevation of apoptosis markers caspase-7 and caspase -9 neither necrosis marker FAS on PC-3M cells treated with 40 μ M β -CBT.

Supplementary Figure S2: Comparison of the histopathological effects of oral β -CBT (15 mg/kg) versus vehicle control treatments on the nude mouse hearts. 20x objective, 200x total magnification.
