

Supplementary Materials: Variation in the microbiome, trichothecenes, and aflatoxins in stored wheat grains in Wuhan, China

Qing-Song Yuan, Peng Yang, Ai-Bo Wu, Dong-Yun Zuo, Wei-Jie He, Mao-Wei Guo, Tao Huang, He-Ping Li and Yu-Cai Liao

Figure S1. PCR amplicons of ITS2 and V3V4 in wheat samples during storage. I, II, and III represent three repeats (silos) of the experiments, 0, 3, 6, 9, and 12 represent the storage times in months in silos.

Figure S2. Distribution of bacteria at the phylum level in wheat stored for 0–12 months at different silos positions. Top, middle, and bottom indicate silo positions. 0, 3, 6, 9, and 12 represent the storage times in months in silos. The top panel represents the variation of the number of classified phyla, the values represent the means of three replicates with the standard deviation (SD); the bottom panel represents the distribution of bacteria at the phylum level.

Figure S3. Distribution of bacteria at the genus level in wheat stored for 0–12 months at different silos positions. Top, middle, and bottom indicate silo positions. 0, 3, 6, 9, and 12 represent the storage times in months in silos. The top panel represents the variation of the number of classified genera, the values represent the means of three replicates with the standard deviation (SD); the bottom panel represents the distribution of bacteria at the genus level.

Figure S4. Distribution of bacteria at the species level in wheat stored for 0–12 months at different silo positions. Top, middle, and bottom indicate silo positions. 0, 3, 6, 9, and 12 represent the storage times in months in silos. The top panel represents the variation of the number of classified species, the values represent the means of three replicates with the standard deviation (SD); the bottom panel represents the distribution of bacteria at the species level.

Figure S5. Correlation of *Fusarium* sp. abundance with other species. Static data of relative abundance of each fungus species at the top, middle, and bottom silo positions, and at different storage time points, and analysis of their relationships. The circular diagrams and flat circles represent lower and higher correlations, respectively; the sample spot distribution represents the significance.

Figure S6. Correlations of *Aspergillus* sp. abundance with other species. Static data of relative abundance of each fungus species at the top, middle, and bottom silo positions, and at different storage time points, and analysis of their relationships. The circular diagrams and flat circles represent lower and higher correlations, respectively; the sample spot distribution represents the significance.

Figure S7. Temperature and relative humidity in Wuhan Storage areas.

Table S1. Data Statistics of ITS sequence

T, M, and B represent the top, middle, and bottom silo positions, respectively; I, II, and III represent the repeat silos of the experiments. Read lengths are the range in each sample, the number of pairs of clean reads following removal of low quality reads. Tags are assembled from clean read pairs, and the tags were clustered to Operational Taxonomic Unit (OTU) by scripts in the program USEARCH (v7.0.1090) at a 97% threshold value.

Table S2. Data Statistics of V3V4 sequence

Sample Name	Reads Length (bp)	Clean Reads	Read Utilization Ratio (%)	Tags Without Primer	Tag Utilization Ratio (%)	Average Length And SD	OTU Number

Static data of relative abundance of each fungal species at the top, middle, and bottom silo positions and different storage time points; analysis of their relationships; Pearson's r represents the correlation coefficient, Sig. indicates the significance level, yellow background indicates a significant correlation at $p < 0.05$ level.
