

Supplementary Materials: Quality-Related Properties of Equine Immunoglobulins Purified by Different Approaches

Sanja Mateljak Lukačević, Tihana Kurtović, Maja Lang Balija, Marija Brgles, Stephanie Steinberger, Martina Marchetti-Deschmann and Beata Halassy

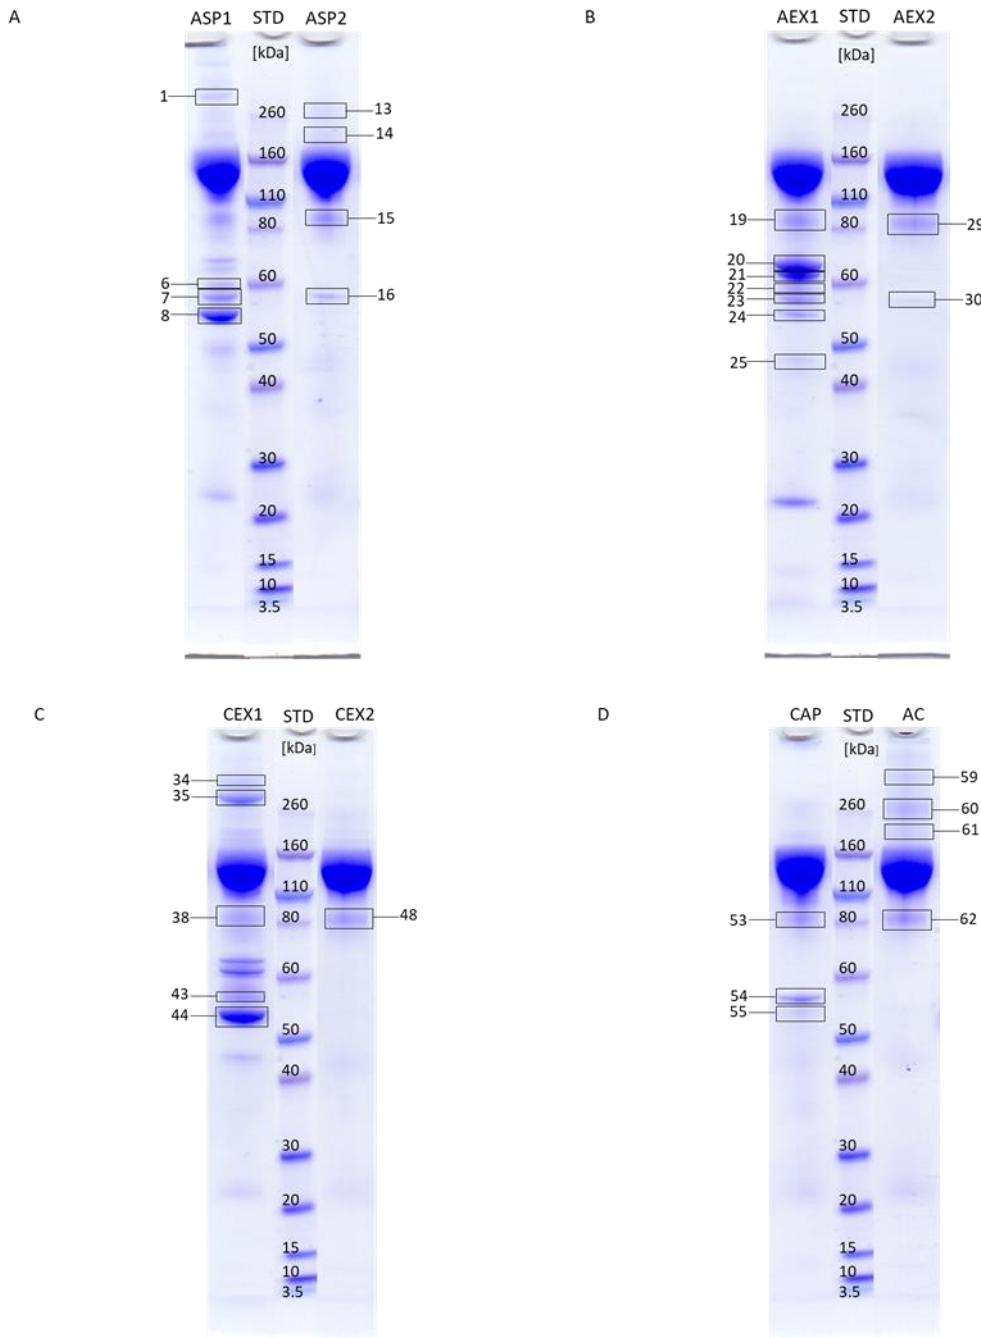

Figure S1. SDS-PAGE analysis of purified IgG fractions under non-reducing conditions with annotation of protein bands identified by MS/MS analysis (in Table S1). IgG samples were obtained by ASP (A), AEX (B), CEX (C), CAP (D) and AC (D) refinement protocols (same samples as in Figure 3). Other protein bands remained unidentified.

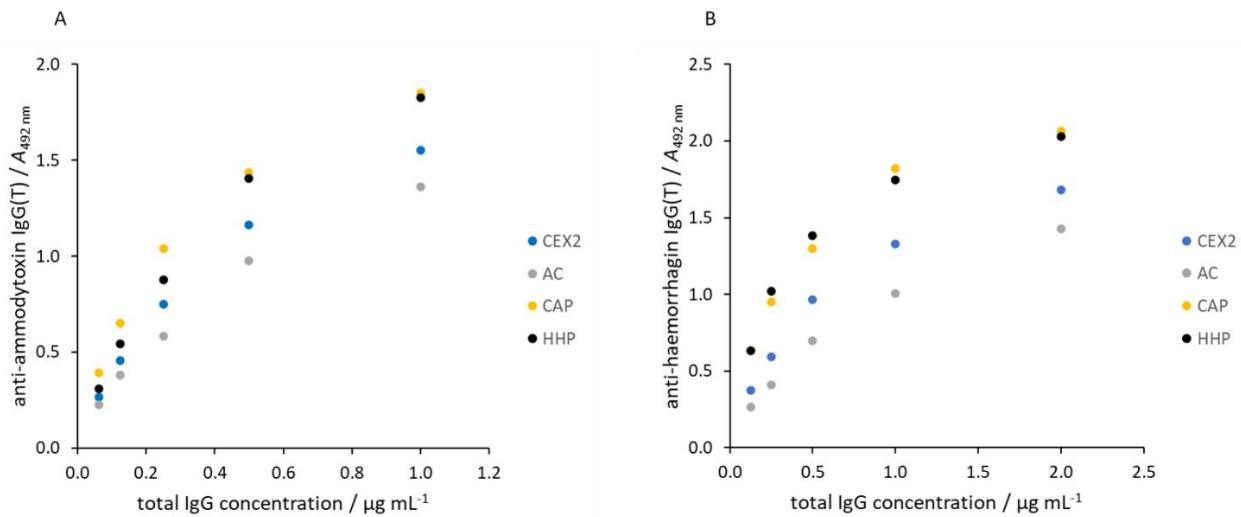

Figure S2. Ammodytoxin- and haemorrhagin-specific IgG(T) subclass determination in purified IgG fractions. Ammodytoxin (Atx) (A)- and haemorrhagin (H)-specific IgG(T) subclass (B) were determined in protein A affinity chromatography (AC), cation-exchange chromatography (CEX2) and caprylic acid precipitation (CAP) samples in comparison to hyperimmune horse plasma (HHP) determined by ELISA. Atx- or H-coated microtiter plates were incubated with IgG preparations and HHP prepared in equal total IgG concentration. Anti- IgG(T) conjugated with HRP was added to visualise Atx- and H- specific antibodies of only IgG(T) subclass.

Table S1. List of proteins identified by MS/MS analysis in the IgG preparations after ASP, AEX, CEX, CAP and AC purification processing.
