

Supplementary dataset 2 – Table1- Latroductins: Sequence alignments of the closest five latroductins already published and the five most concentrated ones in the venom of *Steatoda nobilis*. Bold-italics positions indicate the signal peptide. Yellow windows indicate positions where at least 50% of the identity and/or the physico-chemical properties of the aminoacids are maintained, bold positions are the ones where 33 to 50% of the aminoacids are conserved. Cysteines are highlighted in red.

Supplementary dataset 2 – Table2b- Alpha-Latrocrustotoxins- Sequences from position 701 to 700: Sequence alignments of the closest two alpha-latrocrustotoxins already published and the one found in the venom of *Steatoda nobilis*. Yellow windows indicate positions where the identity and/or the physico-chemical properties of the aminoacids are fully maintained, bold positions are the ones where 66% of the aminoacids are conserved. Cysteines are highlighted in red.

Supplementary dataset 2 – Table 3b- Alpha-Latrotoxins- Sequences from position 501 to 950: Sequence alignments of the closest two alpha-latrotoxins already published and the five most abundant found in the venom of *Steatoda nobilis*. Yellow windows indicate positions where the identity and/or the physico-chemical properties of the aminoacids is maintained at least for 4 possibilities over 7, bold positions are the ones where the positions are maintained 2 or 3 times (over 7). Cysteines are highlighted in red.

Supplementary dataset 2 – Table 3c- Alpha-Latrotoxins- Sequences from position 951 to 1398: Sequence alignments of the closest two alpha-latrotoxins already published and the five most abundant found in the venom of *Steatoda nobilis*. Yellow windows indicate positions where the identity and/or the physico-chemical properties of the aminoacids is maintained at least for 4 possibilities over 7, bold positions are the ones where the positions are maintained 2 or 3 times (over 7). Cysteines are highlighted in red.

Supplementary dataset 2 – Table 4b- Delta-Latroinsectotoxins- Sequences from position 401 to 800: Sequence alignments of the closest two delta-latroinsectotoxins already published and the five most abundant found in the venom of *Steatoda nobilis*. Yellow windows indicate positions where the identity and/or the physico-chemical properties of the aminoacids is maintained at least for 4 possibilities over 7, bold positions are the ones where the positions are maintained 2 or 3 times (over 7). Cysteines are highlighted in red.

Supplementary dataset 2 – Table 4c- Delta-Latroinsectotoxins- Sequences from position 801 to 1176: Sequence alignments of the closest two delta-latroinsectotoxins already published and the five most abundant found in the venom of *Steatoda nobilis*. Yellow windows indicate positions where the identity and/or the physico-chemical properties of the aminoacids is maintained at least for 4 possibilities over 7, bold positions are the ones where the positions are maintained 2 or 3 times (over 7). Cysteines are highlighted in red.
