Nutrient, and Heavy Metal Analyses

The crude protein content of the CSC was estimated using an auto Kjeldahl system (Digest System K-437 and Auto Kjeldahl Unit K-370, Büchi Labortechnik AG, Flawil, Switzerland). Calibrations and nitrogen recovery for protein estimation were done performed using glycine and urea as a standard. The fat and fiber determinations were carried out on a fat extractor (Ankom XT151 Extractor, Macedon, NY, USA) and a fiber analyzer (Ankom A2000I Fiber Analyzer, Ankom, Macedon, NY, USA), respectively using standardized protocols. Calibrations were performed using samples known for their fat and fiber contents. For determination of heavy metals, the samples were digested using nitric and hydrochloric acids and then analyzed for the levels of lead (Pb), chromium (Cr), cadmium (Cd), copper (Cu), and nickel (Ni) using an atomic absorption spectrometer (AAnalyst 700, Perkin Elmer, Waltham, MA, USA).
