

## Supplementary Materials

### Supplementary Information S1: Sample size and power calculations

The conventional thresholds of  $\alpha=5\%$  (significance level) and  $\beta=20\%$  (1-power; power of 80%) were applied for sample size calculation using the statistics programs MedCalc 19.0.6 (MedCalc Software bvba, Ostend, Belgium), GPower 3.1.9.4 (Franz Faul; Kiel University, Kiel, Germany), and GraphPad StatMate 2.0 (GraphPad Software, San Diego, CA, USA).

Receiver-operating characteristics (ROC) analysis was performed to calculate the necessary sample size to evaluate the capacity of the different miRNAs to discriminate between matched pairs of malignant and adjacent normal tissue. According to previous studies, we defined as appropriate discrimination an area under the ROC curve higher than 0.75. A sample size of at least 19 pairs would be necessary.

The necessary sample size was calculated for assessing the usefulness of variables/markers for the clinical prognostic endpoint of biochemical recurrence (BCR). Assuming a difference of 0.20 in the Kaplan-Meier "survival" rate within five-year follow-up after radical prostatectomy and selecting tissue samples in this retrospective study by an alternate selection process of patients with (assuming a rate of 0.70) and without BCR (assuming a rate of 0.90) in a consecutive manner resulting in a ratio of one, a total sample size of at least 67 would be required.

**Table S1.** TaqMan MicroRNA assays used for RT-qPCR analyses Assay names and assay IDs are taken from the nomenclature of the supplier Thermo Fisher. The miRBase accession no., miRBase ID, target sequences, gene family data, and clustered miRNAs were taken from the miRBase database release 22 (Sanger Institute, Manchester, UK; <http://www.mirbase.org>).

Abbreviations: HR, hazard ratio; CI, confidence interval.

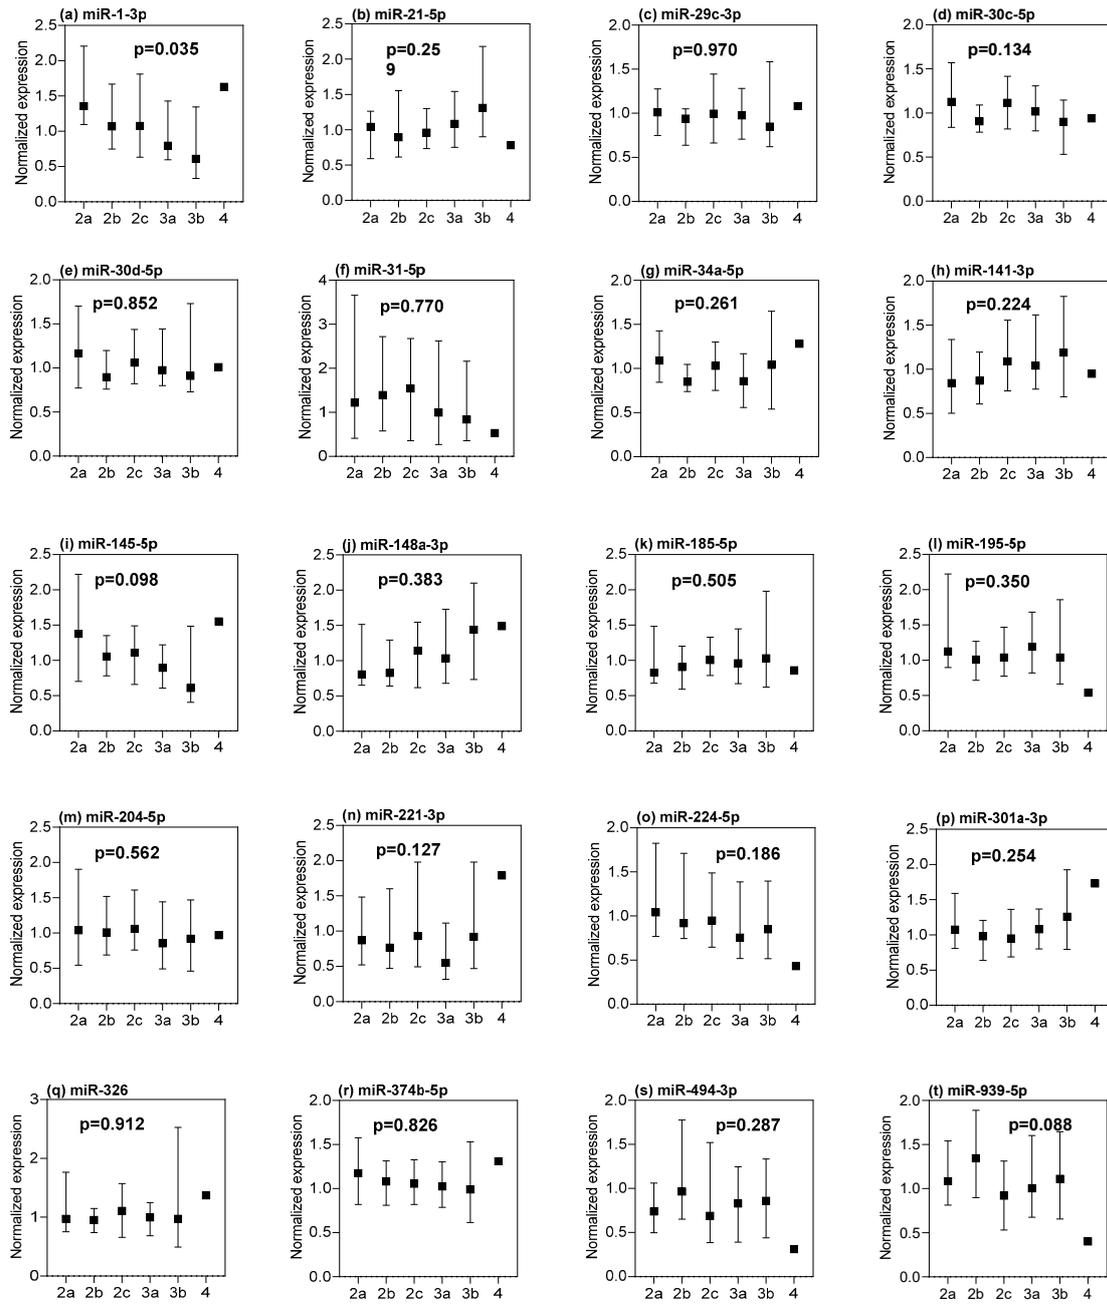

**Table S8.** C-statistics of three predictive BCR models based on only clinicopathological factors in comparison to 5-miR-panels and their combination. Data are given as  $\Delta$ AUCs with  $p$  values in parentheses between the respective models of each group. Abbreviation: BCR, biochemical recurrence.

Model	D'Amico-Based Models		CAPRAS-Based Model		Full Model	
	Pure	Combined	Pure	Combined	Pure	Combined
	$\Delta$ AUC ( $p$ value)		$\Delta$ AUC (p-value)		$\Delta$ AUC ( $p$ value)	
5-miR-panel	0.156 (0.0003)	0.0144 (0.410)	0.0534 (0.248)	0.0243 (0.259)	0.0220 (0.634)	0.0478 (0.0571)
Combined	0.170 (<0.0001)		0.0777 (0.008)		0.0698 (0.007)	

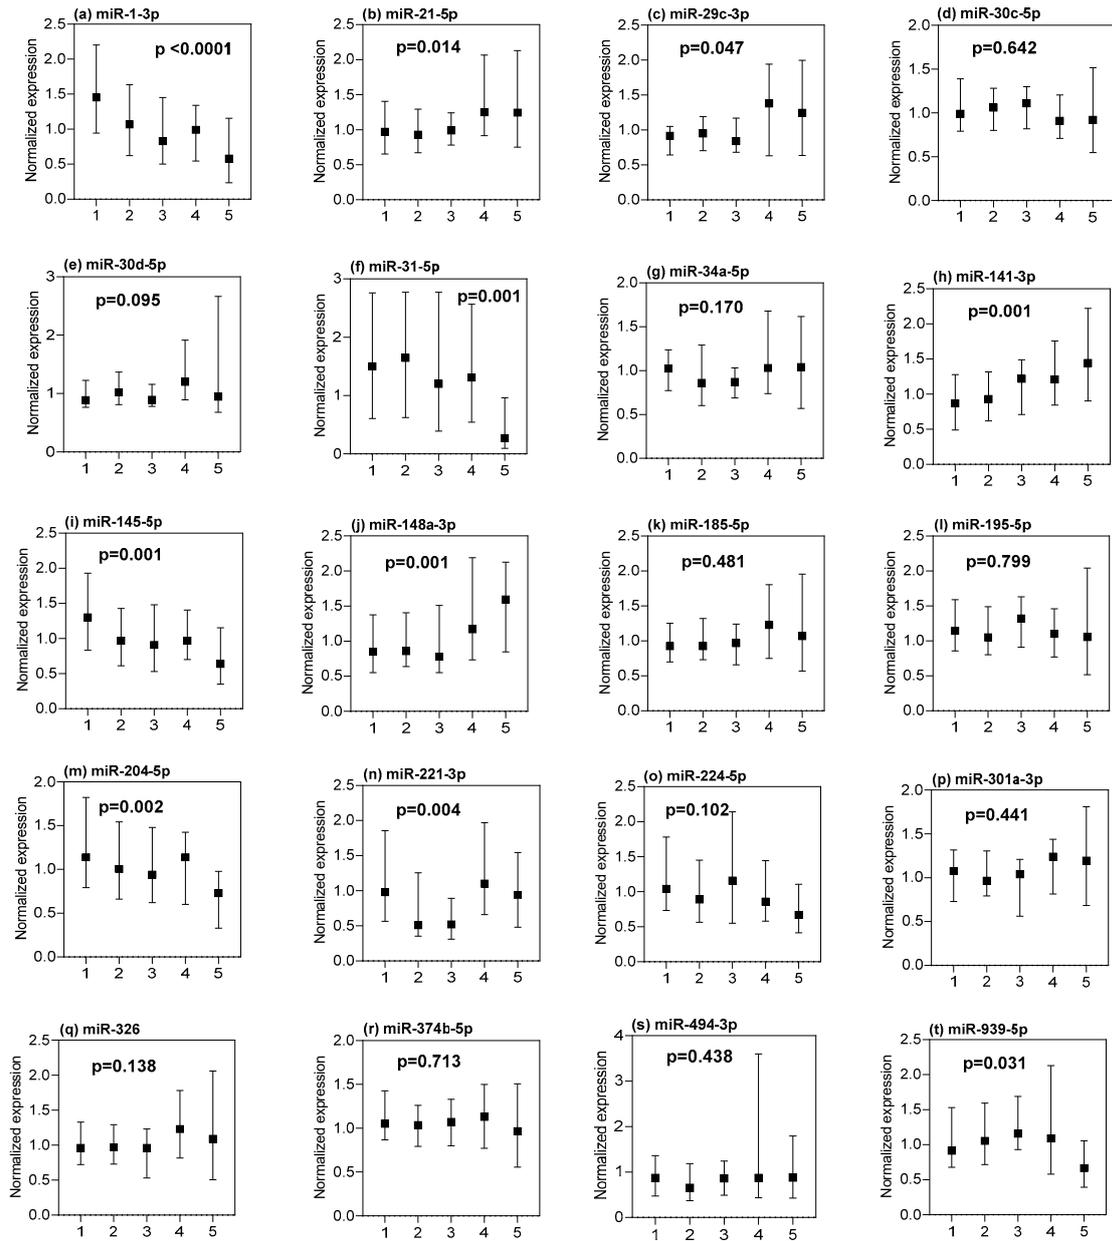

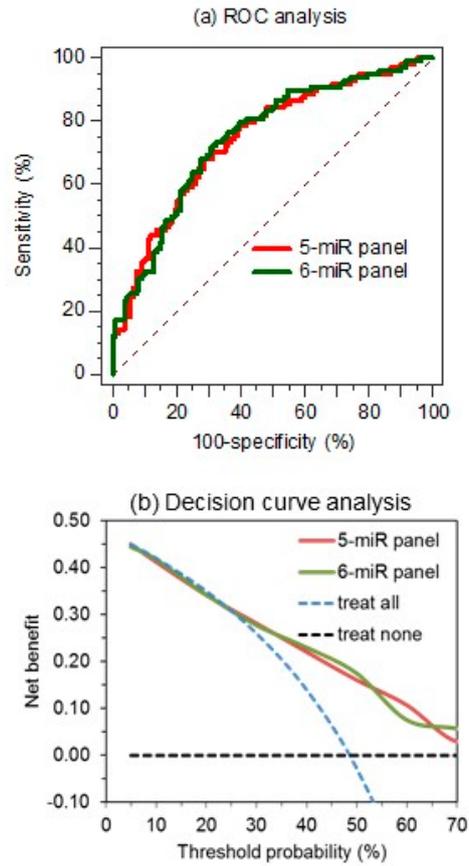

**Figure S1.** Expression of the 20 microRNAs analyzed in adjacent normal tissue samples (N; n=29) and all Pca tissue samples from patients with and without BCR (T; n=206). Normalized miRNA expression data are given as box- and whisker plots. Boxes represent the lower and upper quartiles with medians, whiskers illustrate the ranges of the miRNAs. Mann-Whitney *U*-test was performed. Abbreviations: Pca, prostate cancer; BCR, biochemical recurrence.

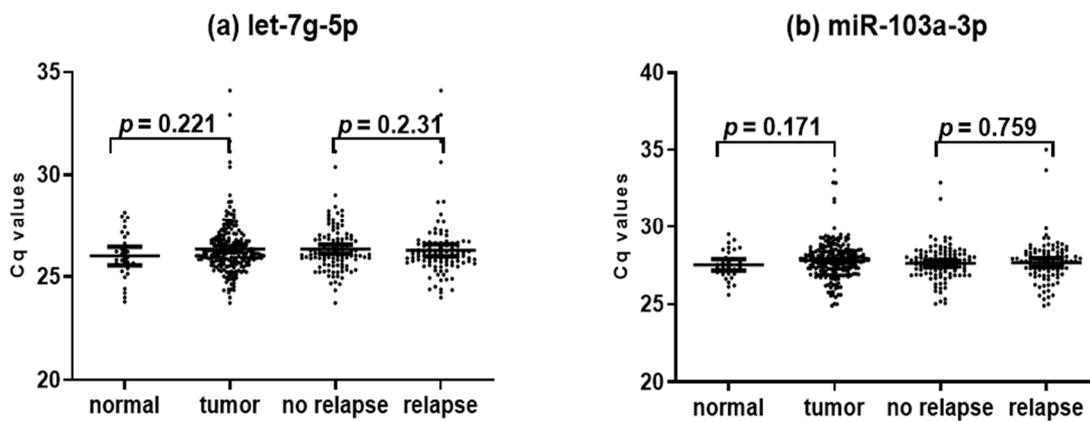

**Figure S2.** Expression of the 20 microRNAs analyzed in PCa tissue samples categorized according to the pT stages. Expression data are given as medians with upper and lower quartiles. Significances are calculated by the Kruskal-Wallis test. Abbreviation: PCa, prostate cancer.

**Figure S3.** Expression of the 20 microRNAs analyzed in PCa tissue samples categorized according to the ISUP grades. Expression data are given as medians with upper and lower quartiles. Significances are calculated by the Kruskal-Wallis test. Abbreviation: PCa, prostate cancer.

**Figure S4.** ROC curve and decision curve analysis of the 5-miR-panel and the 6-miR-panel. Abbreviation: ROC, receiver operating characteristics.

**Figure S5.** Stability of let-7g-5p and miR-103a-3p as suitability criterion for their use as normalizers.
