**Figure S1.** Correlation between LCA and real-time ICA. Comparison of target cell lysis of MCF-7 and MB-MDA-468 via LCA (green bars) or ICA (red bars). Target cell lysis with an E:T ratio of 2:1 via LCA and ICA was determined after 48h and 24h respectively. Data is represented by mean values ( $n=6$ )  $\pm$  SD.

**Figure S2.** Direct CD276 CAR-T cell treatment of MCF-7 organoids expressing GFP. Brightfield (BF) and fluorescence (FL) images of GFP-expressing MCF-7 organoids (green) treated with mCherry-expressing CD276 CAR-T cells (red) in an E:T ratio of 1.5:1 for 48 h. Control conditions represent MCF-7 organoids alone. Scale bar of left two columns: 500  $\mu$ m. Scale bar of right two columns: 100  $\mu$ m.

**Figure S3.** Comparison of target cell lysis between direct CD276 CAR-T and LLE-CD276 AdCAR-T on MCF-7 organoids at an E:T ratio of 0.5:1 and 1.5:1 after 48h. Target cell lysis was normalized to MCF-7 organoids alone. Data shown represents the mean  $\pm$  SD of biological duplicates ( $n = 2$ ) and triplicates ( $n = 3$ ) for direct CD276 CAR-T and LLE-CD276 AdCAR-T respectively.
