

Figure S4

**Figure S4. FISH of a probe generated from laser capture of lagging chromatin (red) and *Germ1*-repeat (green) on meiotic (germline) and mitotic (somatic) chromosomes from somatic line. (A) Hybridization to meiotic chromosomes from testes. The arrow on panel A indicates bivalent that corresponds somatically retained *Germ1* enriched chromosome visible in somatic spreads. (B) A somatic metaphase spread contains one pair of chromosomes which shows hybridization both for LC probe and *Germ1*.**
