

Supplementary Materials

Model 1: trait ~rsPS

Model 2: trait ~rsPS + sex + age + BMI + ancestry (+ diabetic status)

Total genetic variance = r^2 model 1

Environmental variance = r^2 (model 2 – model 1)

Figure S1. Genetic and environmental variances estimation. rsPS: restricted-to-significant polygenic score.

Table S1. List of SNPs genotyped in this study.

	Trait	SNP	Minor allele	Nearest gene	Minor allele frequency

^a Single Nucleotide Polymorphisms (SNPs) are ordered by rs identifier.

^b * means Native American-private risk genetic variants.

^c means SNPs excluded from analyses given their low variation in Mexican people.

^d Ψ means SNP excluded from analyses given their LD with another SNP

^e Weighted allele frequencies for Mexico were computed using contingency tables for survey data

Table S2. Association analyses results for lipid traits.

^a Single Nucleotide Polymorphisms (SNPs) are ordered by gene name.

^b * means Native American-private risk genetic variants.

Figure S2. Variance explained by previously known genes associated to dyslipidemias according to gender.

It is shown the bootstrapped 95% confidence interval for r^2 based on 1,000 replications of regression models for complex surveys including either women or men only.

(a) Biological processes (GO) mostly influenced

(b) Cholesterol metabolism pathway

(c) PPAR signaling pathway

(d) Fat digestion and absorption pathway

Figure S3. Functional role of the genes analyzed in this study. (a) Tree map of the biological processes mostly influenced the genes associated with lipid levels in Mexican population. (b-d) KEGG pathways enriched by the genes associated with lipid levels in Mexican population. Red squares highlight genes with an association p value < 0.05 . Yellow squares highlight genes with an association p value ≥ 0.05 . White squares include genes that were not analyzed in this study.
