

Figure S1. Example of landmarks used for geometric morphometric analysis of body shape, here visualised on the body of a three-spined stickleback individual. For all nine-spined stickleback the same homologous landmarks were used. These 15 landmarks represent a subset of the 19 landmarks that were specifically used for three-spined stickleback in Sharpe *et al.* 2008 ([35] in main paper).

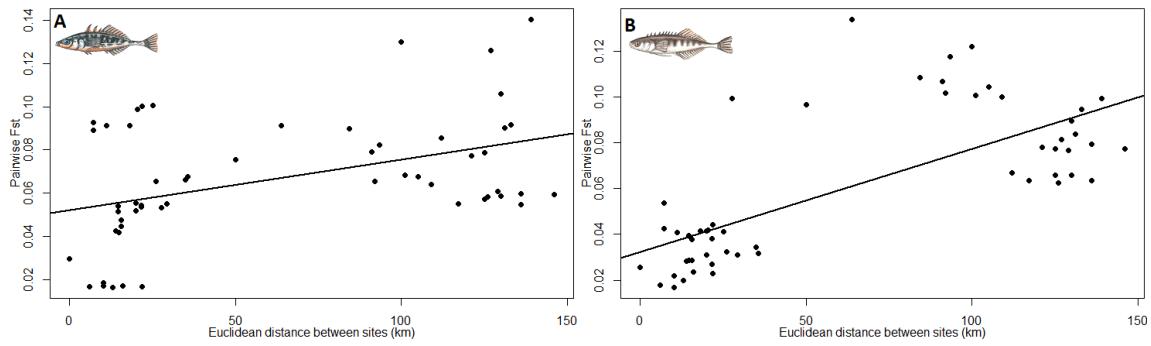

Figure S2. The relationship between Euclidean distances between sites and pairwise F_{ST} in (A) three-spined stickleback ($r = 0.42, P = 0.0487$) and (B) nine-spined stickleback ($r = 0.72, P = 0.0055$).

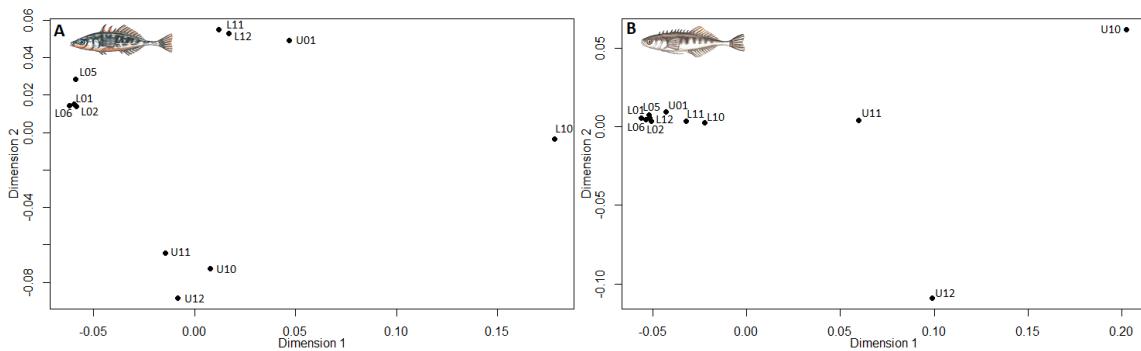

Figure S3. Two-dimensional classical multidimensional scaling of pairwise F_{ST} values in (A) three-spined stickleback and (B) nine-spined stickleback.

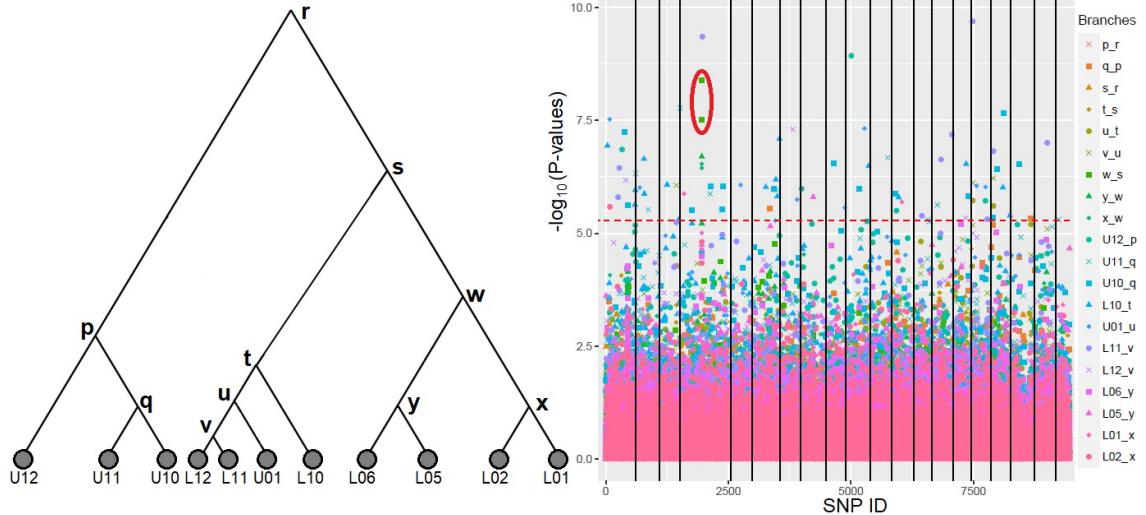

Figure S4. GRoSS v1.0 outlier analysis in three-spined stickleback SNPs along the full genealogy of the eleven populations resulting in a total of 20 outlier tests for each SNP. The horizontal black lines mark linkage groups in chronological order. All SNPs above the red-dashed line represent outliers. The red circle marks two outlier SNPs identified along the w-s branch on LG IV, representing the root of the split between brackish and freshwater sites.

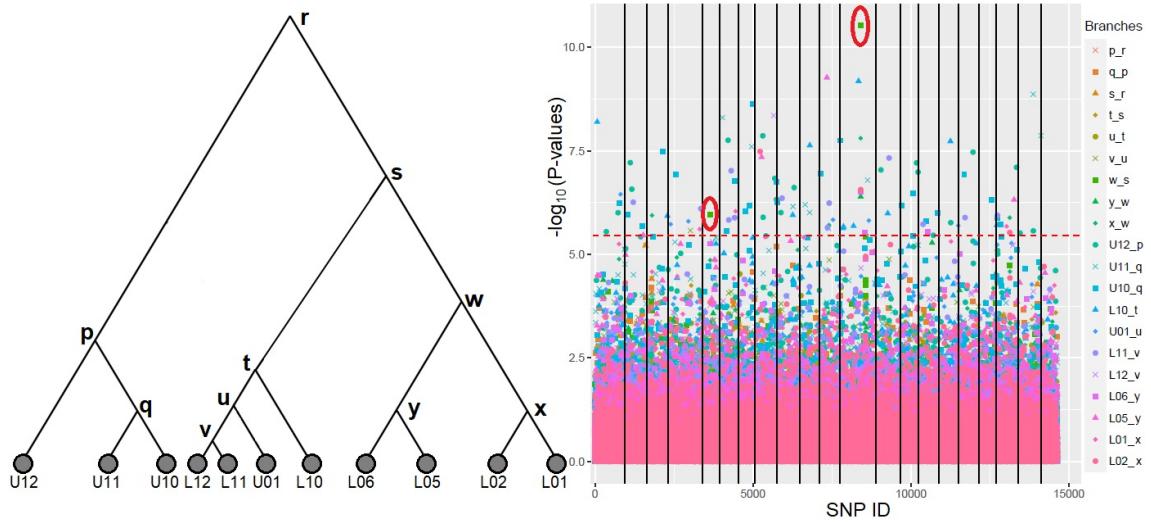

Figure S5. GRoSS v1.0 outlier analysis in nine-spined stickleback SNPs along the full genealogy of the eleven populations resulting in a total of 20 outlier tests for each SNP. The horizontal black lines mark linkage groups in chronological order. All SNPs above the red-dashed line represent outliers. The red circles mark two outlier SNPs identified along the w-s branch on LG V and LG XII, representing the root of the split between brackish and freshwater sites.

Table S1. Pairwise F_{ST} values in three-spined and nine-spined stickleback for eleven sites, with the values for three-spined stickleback above the diagonal and the values for nine-spined stickleback below the diagonal.
