ATG and TAA: Start and Stop codons

5' UTR and 3' UTR sequences and the capsid protein open reading frame portion from the ZIKV genome

CCTGCAGG and GATATC: SbfI and EcoRV cloning sites

Figure S1: gene block sequences

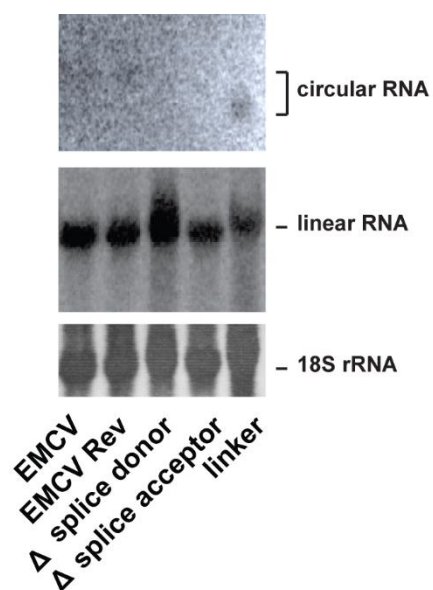

Figure S2: Northern blot analysis to detect circular, linear NanoLuc and 18S rRNA as a control. 10 μ g of total RNA from stably transfected cells were separated by denaturing agarose gel electrophoresis, followed by northern blot analysis using an oligonucleotide hybridized to the NanoLuc splice junction to detect the circular RNA, and to the C-terminal fragment of the NanoLuc to detect the linear RNA.

Figure S2: northern blot

Table S1: primer sequences.
