**Figure S1.** Views of (A) assembled and (BC) disassembled biosampler unit prior to sterilization.

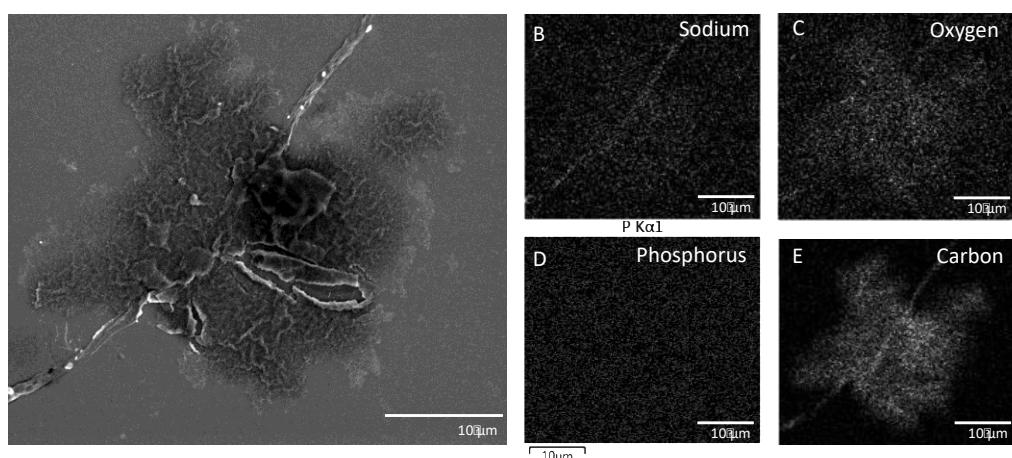

**Figure S2.** Boreholes (A) 12299 with packer and tubing, and 12322 (B) during and (C) after insertion of the biosampler unit.

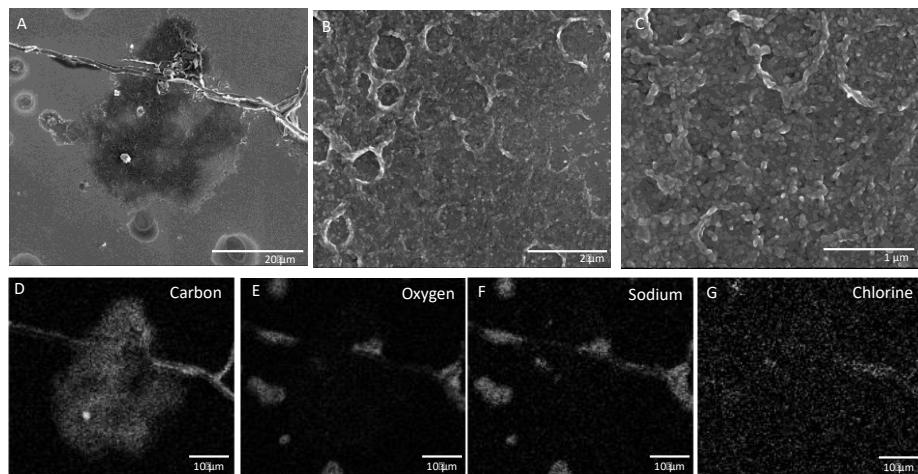

**Figure S3.** 1000 $\times$  phase contrast microscope images of presumed-precipitate features on glass slides from FW12299. Similar structures were seen on glass slides from FW12322 and controls incubated with filtered water from FW12299.

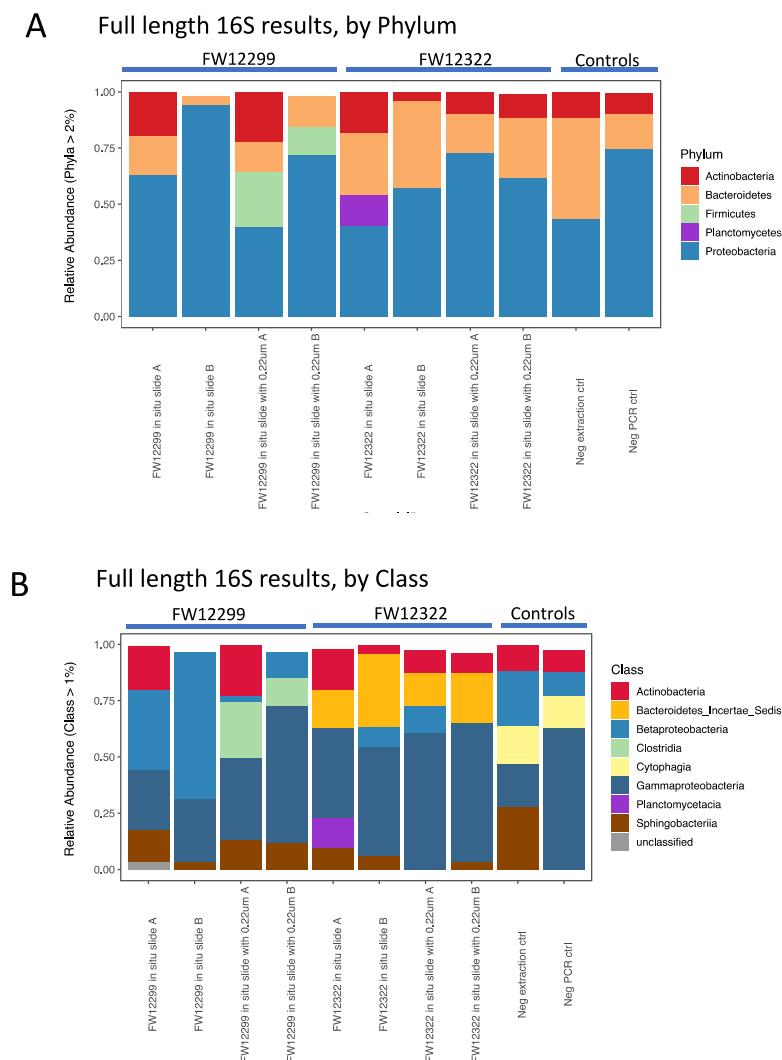

**Figure S4.** Biosampler unit returned after 229 days incubation in 12299. Pictured are two 1" round slides with 0.2 um size exclusion filter (**left**) and two without (**right**).

**Figure S5.** (A) SEM and (B–E) EDS images of an additional FW12322 biofilm.

**Figure S6.** (A-C) SEM and (D-G) EDS views of biofilm from FW12322 that is texturally similar to biofilms seen in FW12299. FW12322 was open to exchange with the mine environment prior to biofilm insertion.

**Figure S7.** Classification of full length 16S gene OTUs for in situ incubation surfaces by (A) phylum and (B) class. Results are more variable than those obtained by MiSeq sequencing but still show a strong enrichment of Bacteroidetes in boreholes recently exposed to the mine (FW12322) and the presence of Clostridia in the packered (“corked”) borehole (FW12299).

**Table S1.** Geochemistry data for major cations and anions from FW12299, FW12287A, and FW12322 from the 2.4 km level of the mine.
