

Novel Perspective on Alzheimer's Disease Treatment: Rosmarinic Acid Molecular Interplay with Copper(II) and Amyloid β

Arian Kola¹, Aleksandra Hecel², Stefania Lamponi¹ and Daniela Valensin^{1,*}

Figure S1. ESI-MS spectra of Cu(II)–RA system recorded in (**A**) negative and (**B**) positive ion mode. Molar ratio M:L 1:2; [L] = 5.0×10^{-4} M. The complex was prepared in a mixture of MeOH:H₂O (1:1) at

pH 7. For chosen complexes, a comparison of the experimental a) and simulated b) signals was performed.

Figure S2. EPR spectra of RA–Cu(II) system in phosphate buffer (20% of ethylene glycol) at pH 7.4. T = 77K (X-band – 9.5 GHz). [Cu(II)] = 1.0×10^{-3} M, molar ratio M:L a) 1:1 and b) 0.5:1.

Figure S3. UV–VIS spectra (d–d transitions) of RA at pH 7.4 in presence of increasing Cu(II) concentrations. [RA] = 2.0×10^{-3} M; [phosphate buffer] = 1.8×10^{-2} M.

Figure S4. Comparison between UV–VIS spectra of RA–Cu(II) complex at pH 7.4 and of RA at basic pH. [RA] = 5.0×10^{-4} M; [Cu(II)] = 2.5×10^{-4} M; [phosphate buffer] = 1.8×10^{-2} M.

Figure S5. Superimposition of ¹H NMR spectra in absence (apo, black line) and in presence of increasing concentration of Cu(II) ions (colored lines). [RA] = 5.0×10^{-4} M; [phosphate buffer] = 1.8×10^{-2} M.

Figure S6. R_{1p} values of RA protons measured in solutions with 0.01 Cu(II) eqs. (dark grey) and 0.02 Cu(II) eqs. (light grey). [RA] = 5.0×10^{-4} M; [phosphate buffer] = 1.8×10^{-2} M.

Figure S7. Ames test performed on *S. typhimurium* strain TA98, with and without S9 fraction, for RA (**a**, **b**), Cu(II) (**c**, **d**) and RA–Cu(II) complex (**e**, **f**). The Cu(II) concentration in the RA–Cu(II) complex was 10 µM for each RA concentration(10, 15, 30, 60, 90, and 300 µM).

Figure S8. Ames test performed on *S. typhimurium* strain TA100, with and without S9 fraction, for RA (**a**, **b**), Cu(II) (**c**, **d**) and RA–Cu(II) complex (**e**, **f**). The Cu(II) concentration in the RA–Cu(II) complex was 10 μ M for each RA concentration (10, 15, 30, 60, 90, and 300 μ M).

Figure S9. EPR spectra of (**a**) RA–Cu(II), (**b**) A β 16–RA–Cu(II), (**c**) A β 28–RA–Cu(II) systems in phosphate buffer (20% of ethylene glycol) at pH 7.4. T = 77K (X-band – 9.5 GHz). [Cu(II)] = 1.0×10^{-3} M; [RA] = [A β] = 2.0×10^{-3} M; [phosphate buffer] = 1.8×10^{-2} M.

Figure S10. Superimposition of 2D NMR ¹H-¹H TOCSY of A β 16–RA (black contours) and A β 16–RA–Cu(II) (magenta contours) systems. [RA] = [A β] = 1.0 × 10⁻³ M; [Cu(II)] = 4.0 × 10⁻⁵ M; [phosphate buffer] = 1.8 × 10⁻² M.

Figure S11. R_{1p} values of RA protons measured in A β 16–RA solutions with 0.02 Cu(II) eqs. (dark grey) and 0.04 Cu(II) eqs. (light grey). [RA] = [A β] = 5.0 × 10⁻⁴ M; [phosphate buffer] = 1.8 × 10⁻² M.

Figure S12. Comparisons between R_{1p} values of RA protons measured for A β 16–RA–Cu(II) (black squares) and RA–Cu(II) (grey circles) solutions. [RA] = [A β] = 5.0 × 10⁻⁴ M; [Cu(II)] = 1.0 × 10⁻⁵ M; [phosphate buffer] = 1.8 × 10⁻² M.
