

Supplementary Figures and Tables

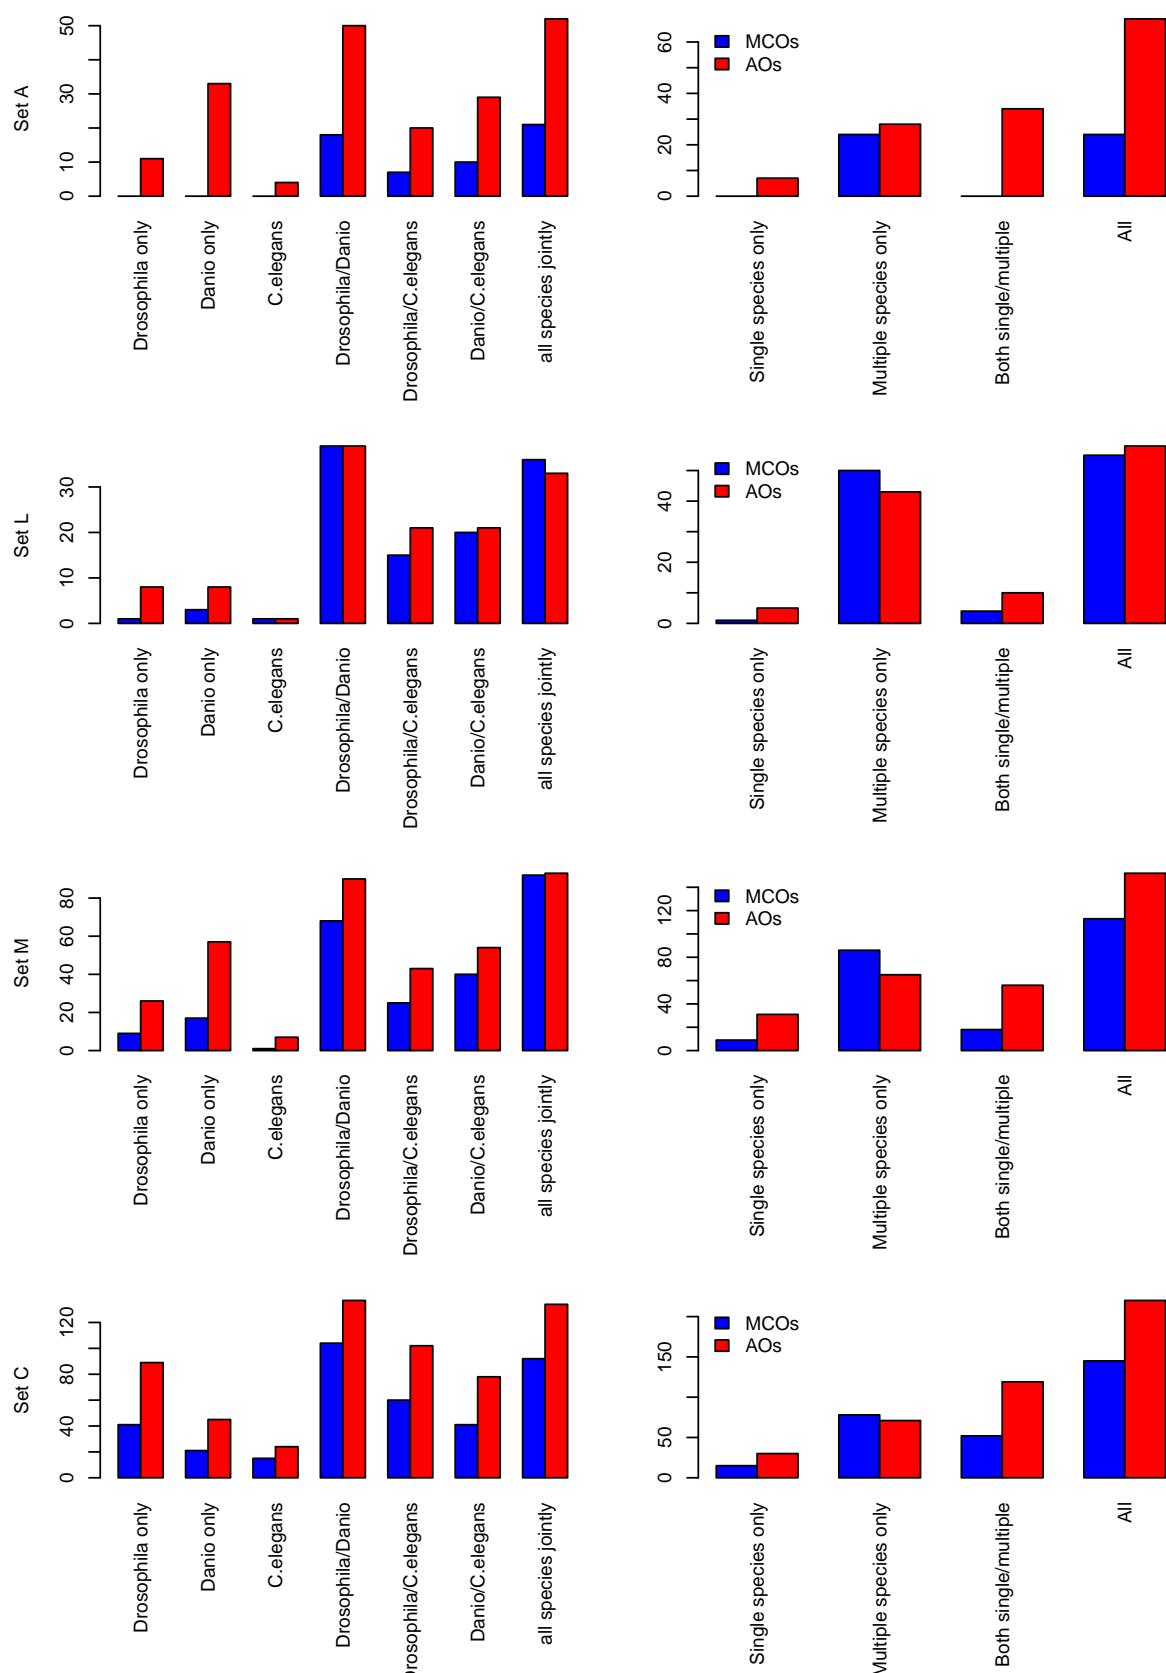

Figure S1. Supplementary Figure related to Figure 4. MSGEA vs. single species enrichment analysis for clusters of orthologous proteins (COPs). Number of significant terms shown for each of the four sets *A*, *L*, *M*, and *C* (cf. Figure 1).

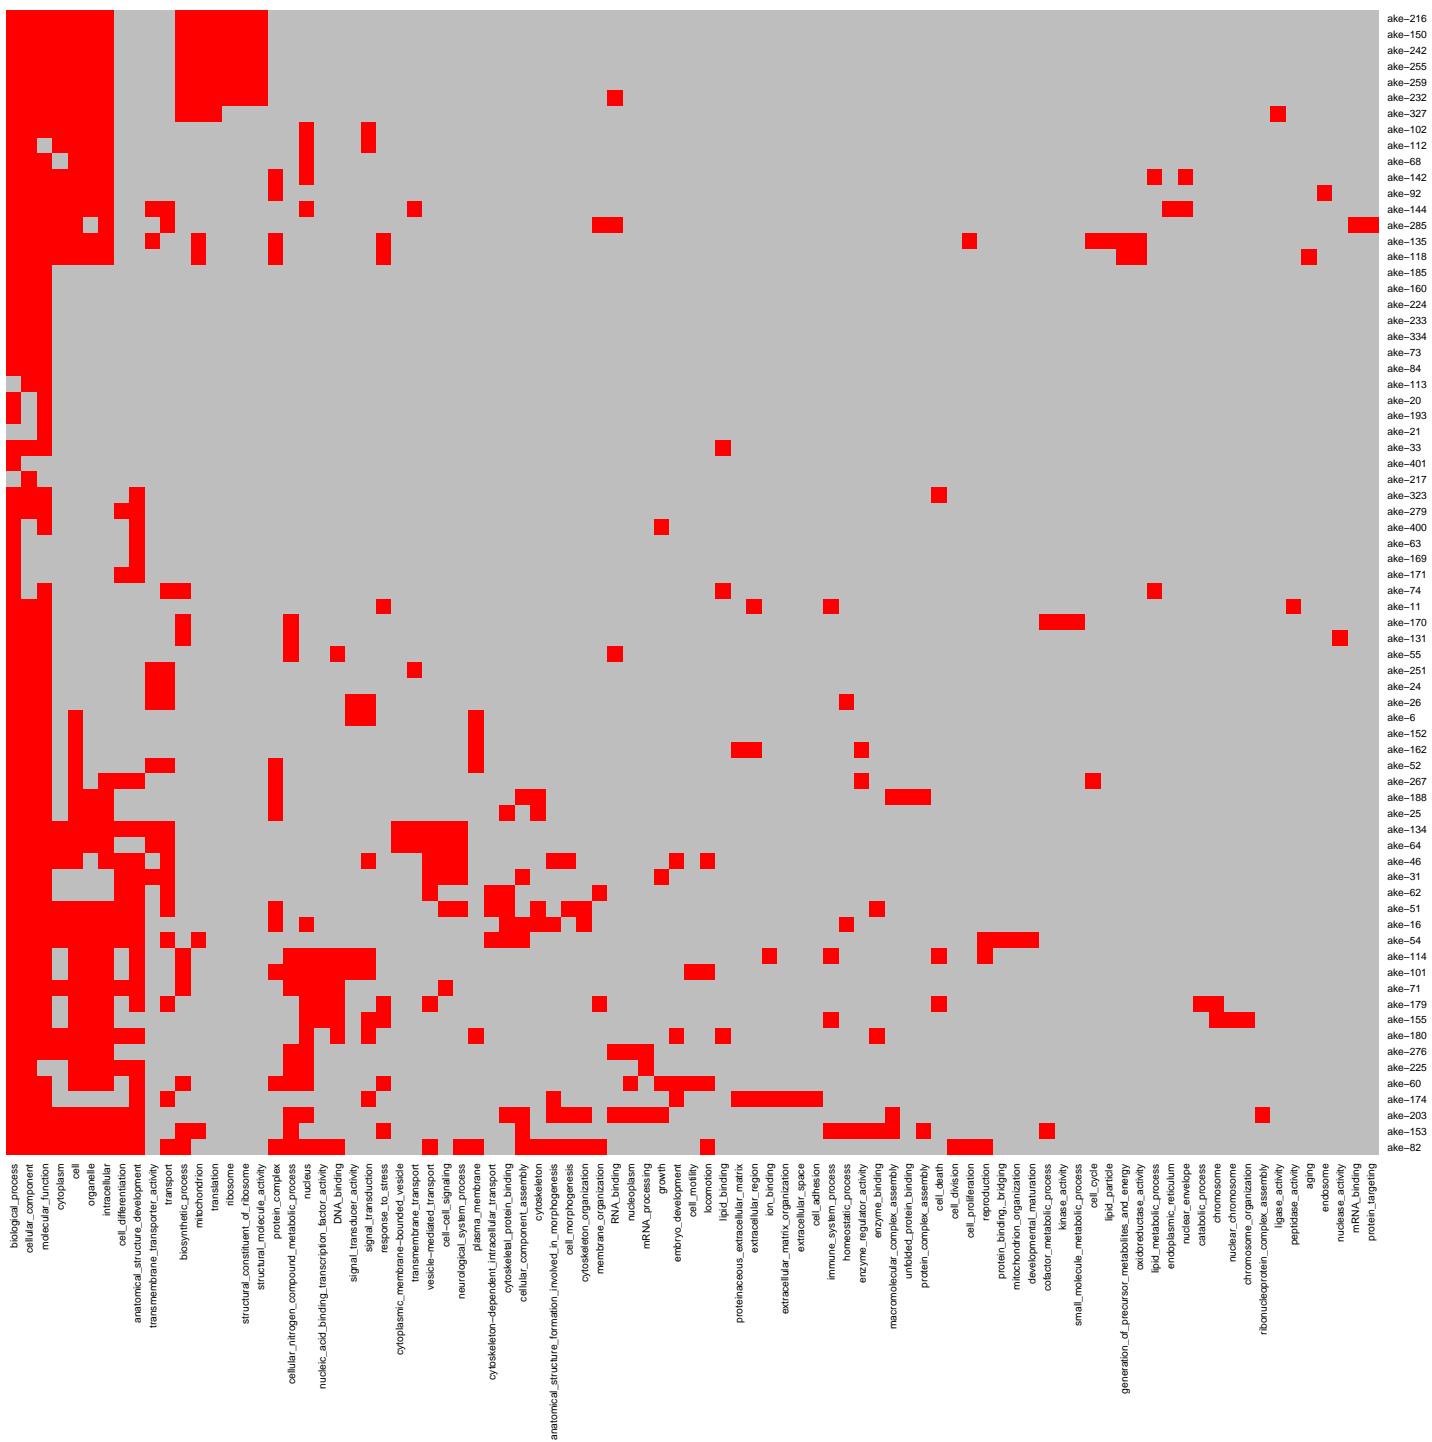

Figure S2. Supplementary Figure related to Figure 5. Absence/presence map of GO-slim terms. *x*-axis: GO-slim terms (including all GO levels); right *y*-axis: internal COP IDs.

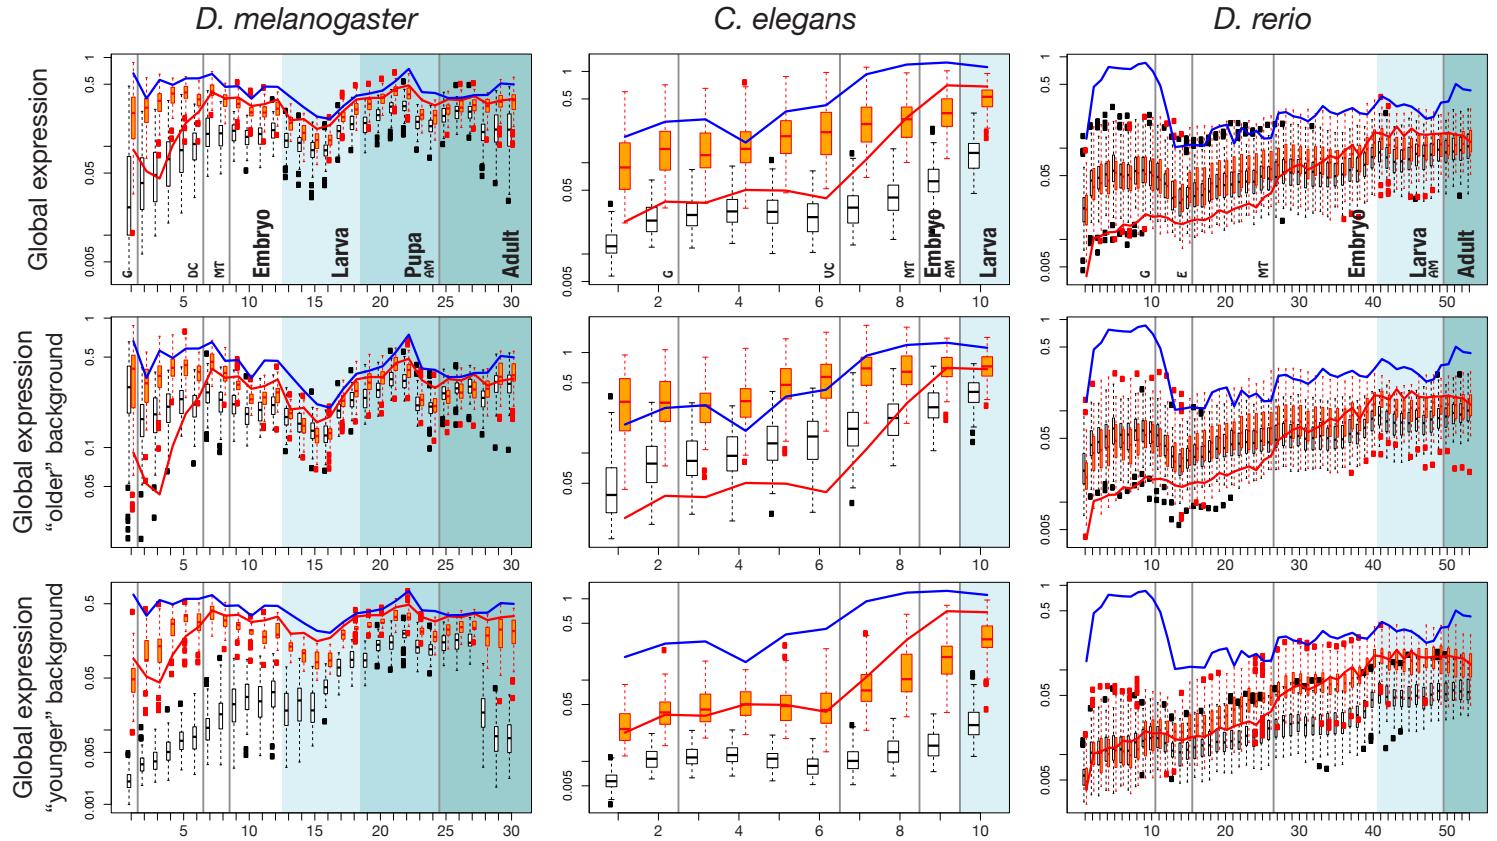

Figure S3. Supplementary Figure related to Figure 3. Expression profiles with background distribution based on medians, instead of means. Color code and other labels as in Figure 5.

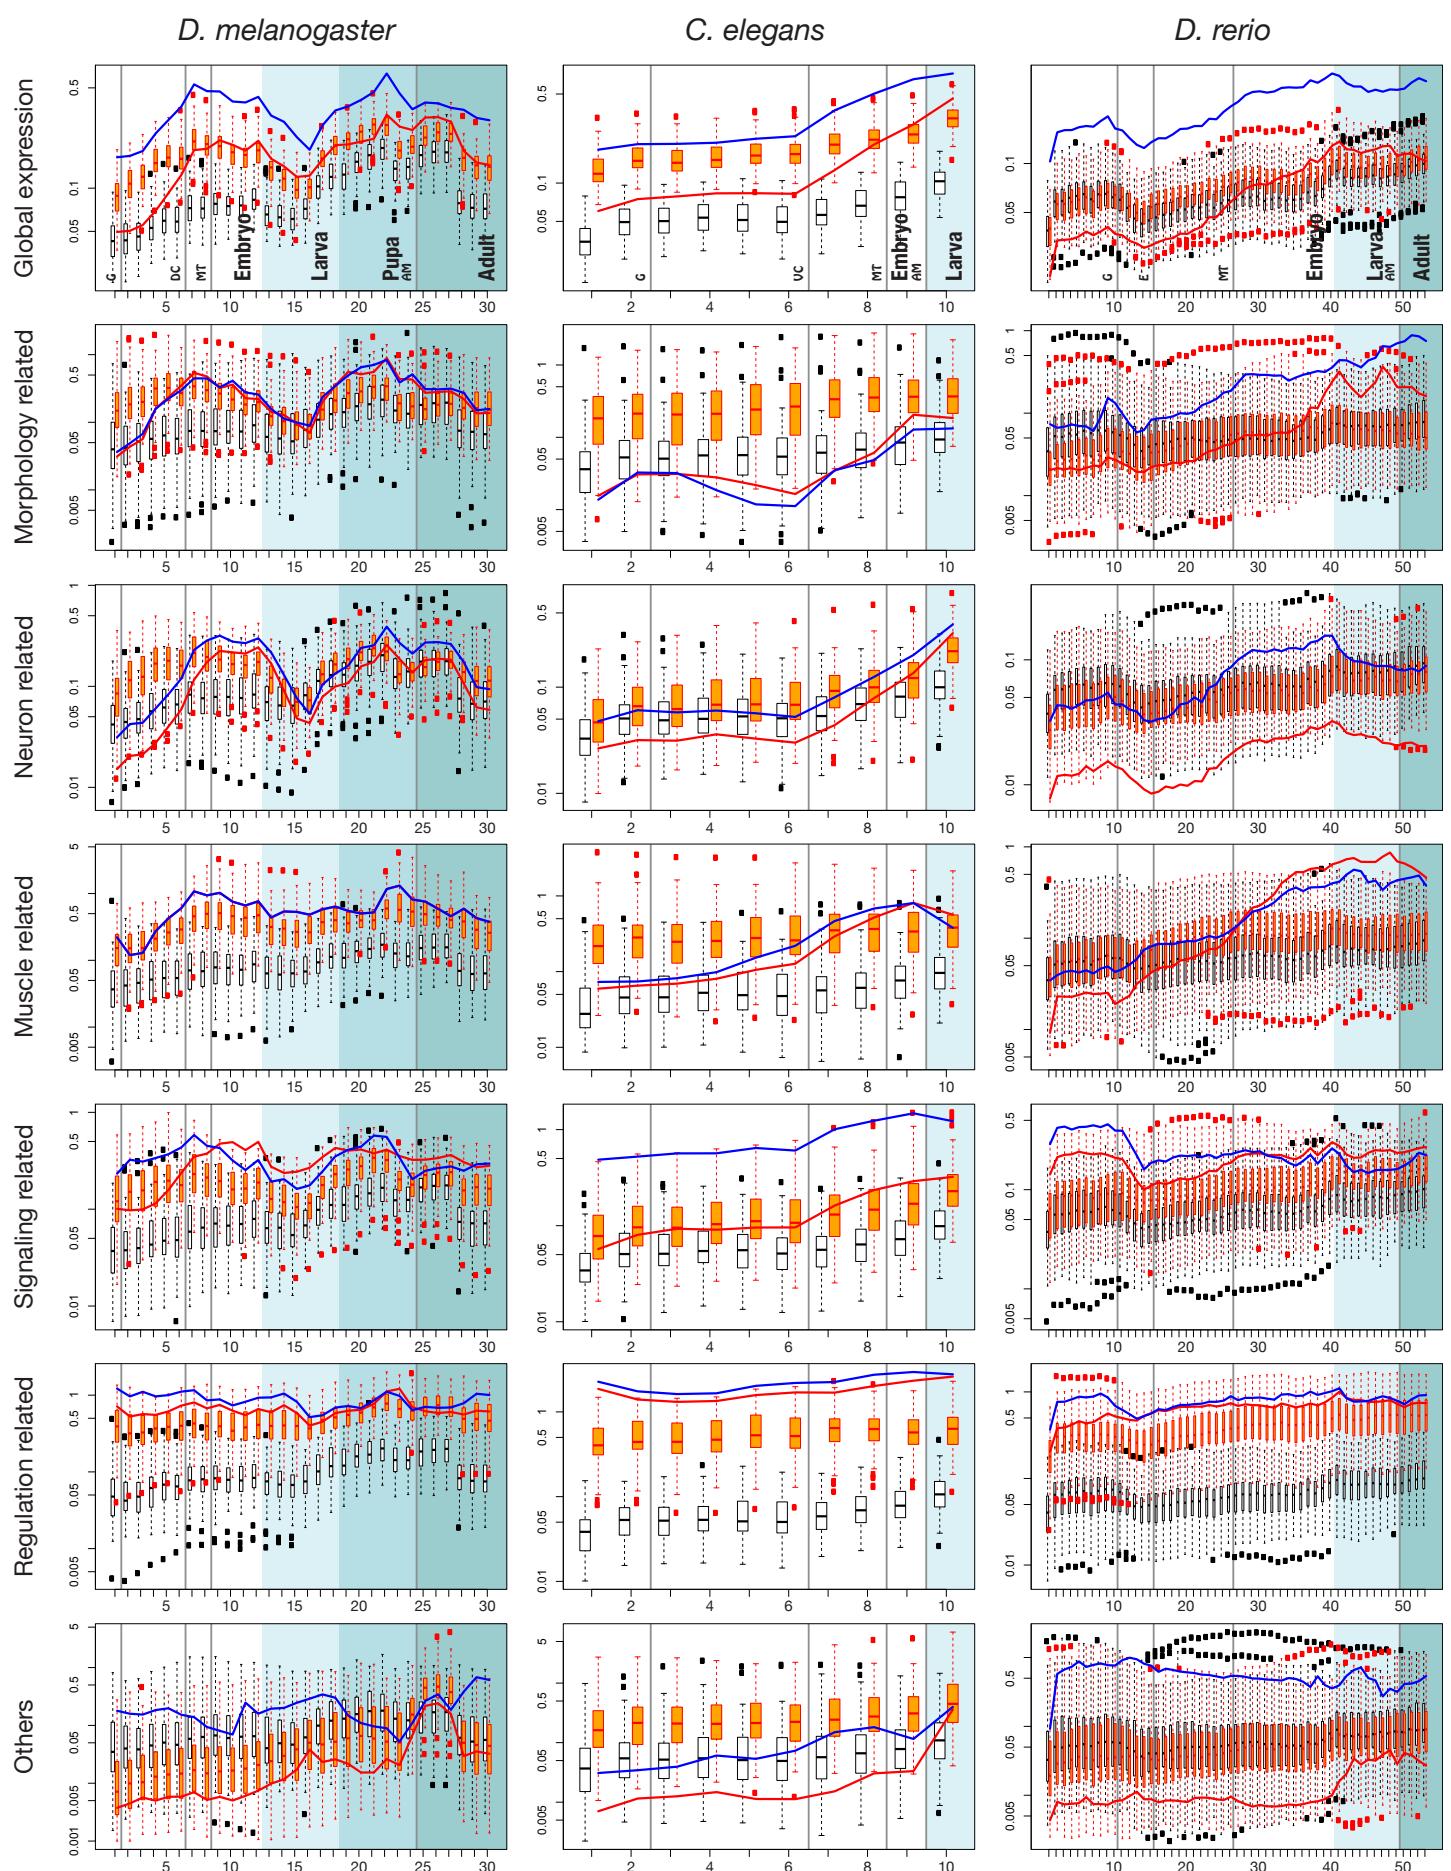

Figure S4. Supplementary Figure related to Figure 3. Expression profiles of set L' genes by functional classes. Background distributions based on mean expression values. Color code and other labels as in Figure 5. *D.m.*, 'muscle': there are no paralogs; therefore, only the blue line (for MCOs) is displayed.

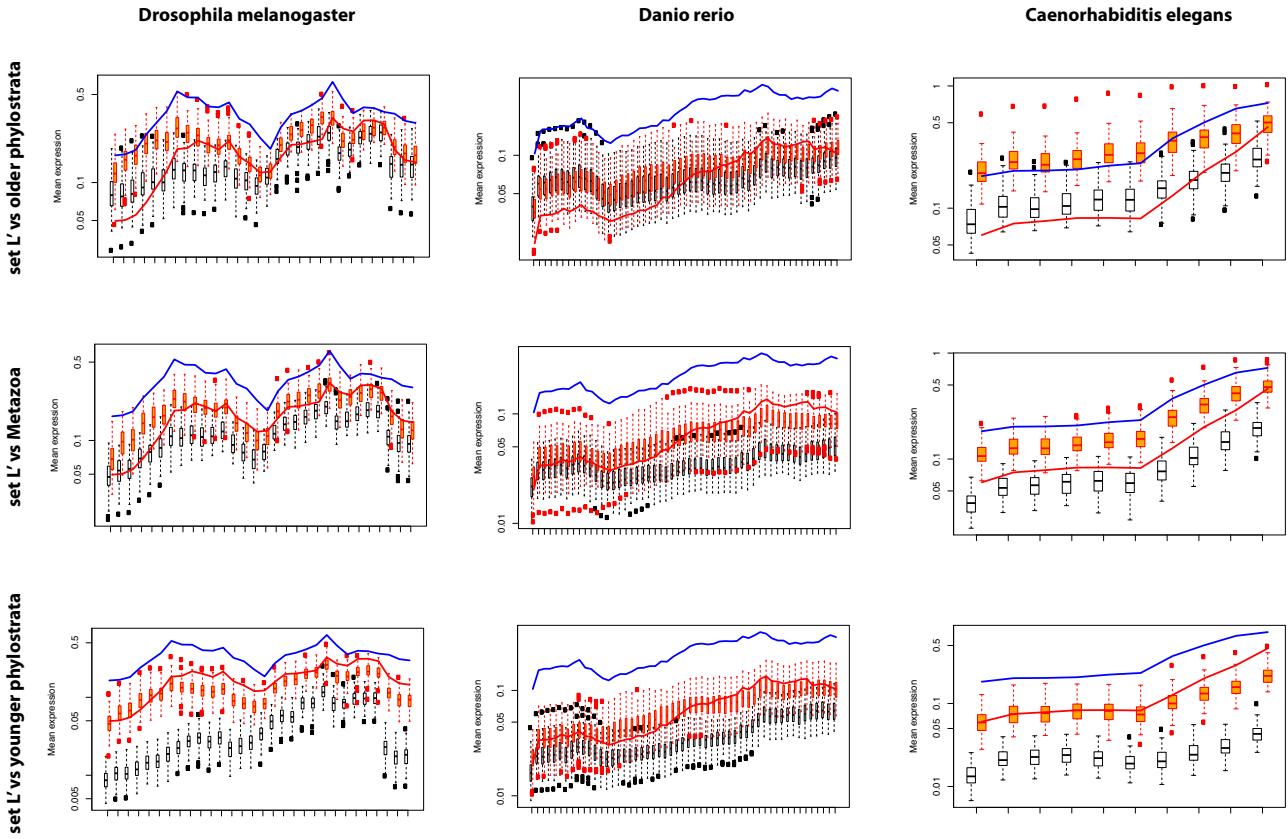

Figure S5. Supplementary Figure related to Figure 3. Expression profiles of set L' genes compared to different background distributions, including all phylostratigraphically older and younger genes at the top and bottom, and all Metazoan genes in the middle. Background distributions based on mean expression values. Color code and other labels as in Figure 5.

*due to the incomplete assembly and annotation status of the *A. californica* genome, APL was ignored when determining the number of losses. When *A. californica* is included only one cluster contains orthologs from all species (last line). Omitting *A. californica*, we find 33 clusters which contain orthologs from nine species (first line). In the remaining 91 clusters in set *L* an ortholog from at least one species is missing. Most losses (31 of 91) are *C. elegans*-specific (second line).

Table S2. Supplementary Table with annotation of *x*-axis tick marks in Figure 5, Figure S3 and Figure S4 according to [75] (*D. melanogaster*), [124] (*C. elegans*) and [48] (*D. rerio*).
