

## Supplementary Materials

Genome sizes were obtained from Genbank and the respective genome sequencing projects. Proteome sizes were determined by counting all codons present in the respective genomes. Mutation rates were obtained from the references listed. In multicellular eukaryotes the rates are per cell division, the number of germline cell divisions per generation were derived from Drake *et al.* [1], and Hoffman *et al.* [2] Genes Dev 18, 2676 for *A.thaliana*. These numbers are in brackets.

**Table S1.** Mutation rates of genomes that encode their own replication apparatus.

Genome	Mutation rate per bp per genome replication	Genome size (bp)	Proteome size (codons)	References
