ID: Patient Identity; DX: Diagnosis; CNS Dx: Central Nervous System Involvement at Diagnosis; CR: Complete Remission; HSCT: Hematopoietic Stem Cell Transplantation; R: Relapsed; r: Refractory; M: Male; F: Female; MPL: Mixed Phenotype Leukaemia; B-ALL: B-cell-progenitor Acute Lymphoblastic Leukaemia; T-ALL: T-cell-progenitor Acute Lymphoblastic Leukaemia; AML: Acute Myeloid Leukaemia; CNS-1: absence of blast in cerebrospinal fluid; CNS-2: blasts & < 5 white cells/µL in cerebrospinal fluid; CNS-3: blasts & > 5 white cells/µL in cerebrospinal fluid; BM: Bone Marrow; CNS: Central Nervous System; TRM: Transplant-related Mortality; cGvHD: Chronic Graft Versus Host Disease; AWB: aplasia without blasts.

¹ HRL 1 diagnosed with MPL received as first line induction treatment a lymphoid-polychemotherapy scheme, with a refractory and progressive disease. Then, a second line treatment with a myeloid-polychemotherapy scheme was given, achieving CR. After that, HSCT was performed.

² HRL 4 was diagnosed with B-ALL. Conventional induction treatment was started, and after evaluation, patient was diagnosed with an induction failure. In this moment, HRL 4 continued first-line treatment plus ruxolitinib, achieving after that CR. HSCT was then performed.

³ HRL 7 diagnosed with AML, suffered a refractory disease. Salvage chemotherapy plus sunitinib was given. After that, patient achieved CR and HSCT was performed. A year later, and 4 months after sunitinib discontinuation, HRL 7 suffered a relapse.

⁴ HRL 10 underwent to HSCT in aplasia without blast status after salvage chemotherapy because of the high risk of the disease.

*Clinical Trial NCT03793478.
