

Figure S1. Secondary antibody titration. Initial titration of secondary antibody to determine the optimal concentration to be used in the assay. The graph demonstrates the optical density (OD) values for different secondary antibody serial dilutions from 500 to 32,000 for two different antigen densities: 4×10^7 and 8×10^7 rickettsiae per well. The arrow shows the inflection point of 1:8000, which we used in the assay until the optimal dilution (1:12,000) was determined later.
