Data shown are from triplicate experiments. Difference in the degrees of adhesion was found to be significant ($P < 0.0001$). ^aBacterial adhesion determined by enumerating the number of bacterial cells per 25 randomly selected Calu-3 cells in triplicates. ^bMean Percentage calculated by identifying bacterial cells displaying adherence to 100 randomly selected Calu-3 cells. ^cDA: diffuse; LA: Localized.

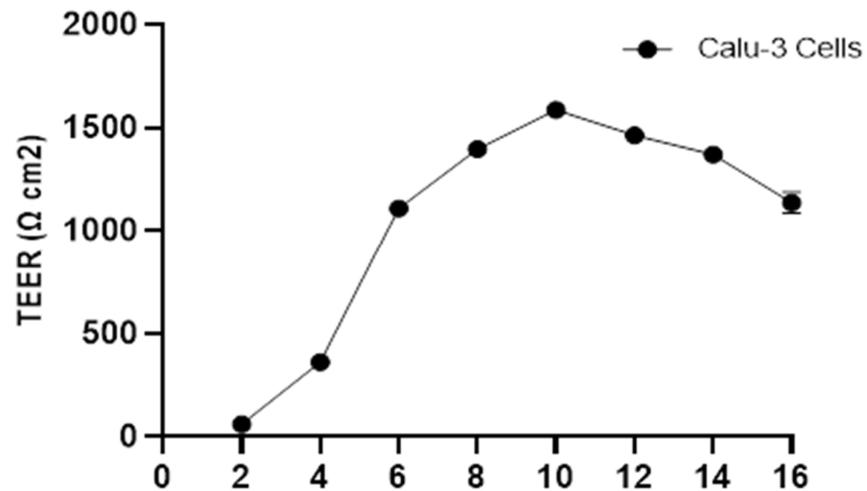

Figure S1. Change in TEER values of calu-3 cells following 16 days post seeding. Data shown are from triplicate experiments and plotted as the mean \pm SEM. Maximum TEER value (1588 Ω cm²) obtained on day 10 post seeding.
