

# Influence of Different Feed Physical Forms on Mandibular Gland in Growing Pigs

Cecilia Dall’Aglio, Francesca Mercati, Elena De Felice, Federico Maria Tardella, Josef Kamphues, Maria Grazia Cappai, Paola Scocco

**Table S1.** Feed components and chemical composition.

| Component              | Percentage           |
|------------------------|----------------------|
| Barley                 | 34                   |
| Wheat                  | 40                   |
| Soybean meal           | 20                   |
| Soybean oil            | 1.1                  |
| Mineral vitamin Premix | 2.2                  |
| Skim milk powder       | 2                    |
| L-lysine               | 0.5                  |
| α-Methionine           | 0.2                  |
| Chemical composition   | g/Kg of dry material |
| Crude ash              | 45.8                 |
| Crude protein          | 186                  |
| Crude fat              | 37                   |
| Crude fiber            | 42.1                 |
| Starch                 | 406                  |

**Table S2.** Specificity of the primary antibodies used

| Antibody used   | Species | % identity with swine full protein sequence |
|-----------------|---------|---------------------------------------------|
| Apelin          | human   | 83.12                                       |
| Apelin receptor | human   | 92.69                                       |
| Aquaporin 5     | rat     | 92.08                                       |

**Figure S1.** Immunohistochemistry positive controls. Sheep abomasum sample for APLN (a) ad APLNR (b); sheep mandibular gland for AQP5 (c).

**Figure S2.** Pig mandibular gland. Immunohistochemistry negative controls for APLN (a), APLNR (b) and AQP5 (c) are treated with hematoxylin to contrast the parenchymal structures. Asterisks (\*) indicate the MG ducts.
