

Supplementary Figure S3 fMRI activation to the three conditions. An overview of the regions in which there was significant activation to Go trials in the (a) All Go, (b) Go Bias, and (c) No-Go Bias conditions. Slices are depicted in increments of 10 mm, starting at $z = -10$ and ending at $z = 60$. Activations were reported for clusters that had a corrected p -value of $p < .05$ at the cluster level.
