

Supplementary figures

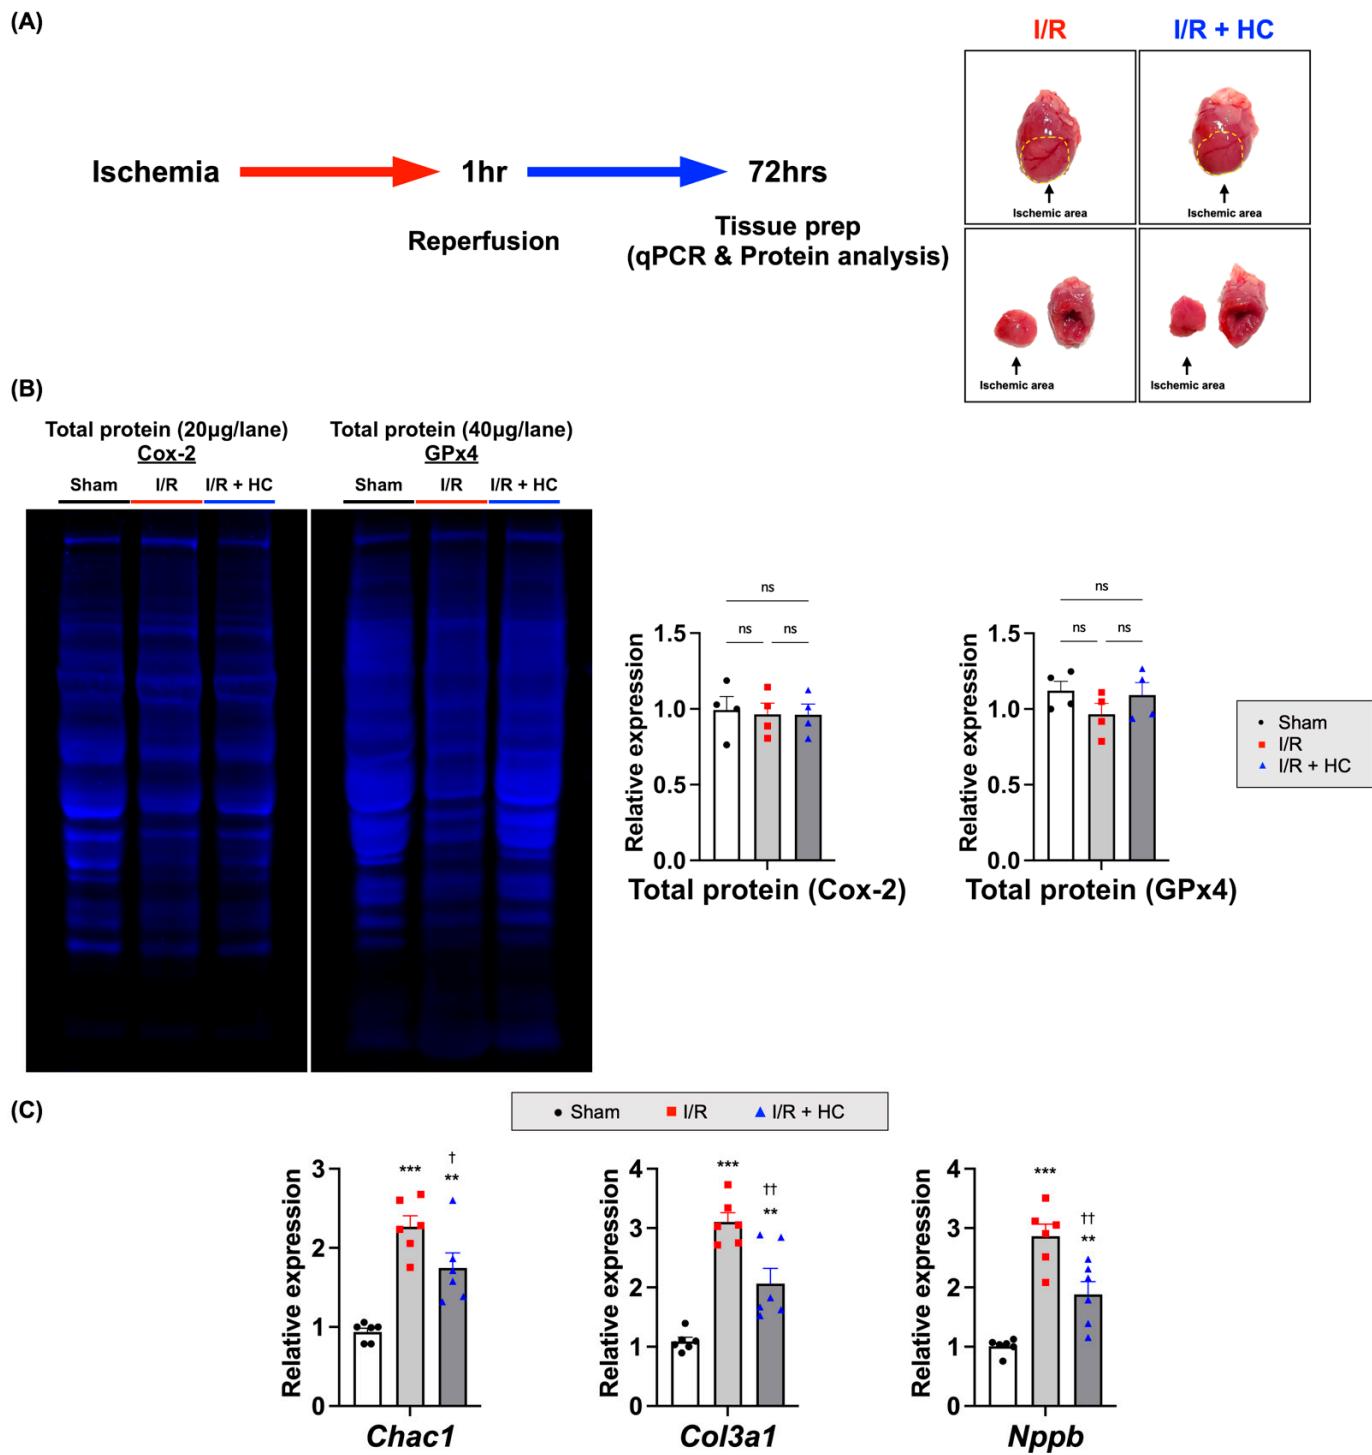

Figure S1. The relative mRNA expression level of ferroptosis related genes after I/R injury. (A) Experimental process of heart tissue sample preparation. All tissue samples obtained from the area at risk (yellow line). (B) The relative images of total protein stain. The total protein was used for normalization of the quantitative analysis. No significant difference among the three groups ($n=4$) by one-way ANOVA. Error bars show means \pm SEM. (C) The relative mRNA expression level of ferroptosis and heart failure related genes using heart tissue harvested 3 days after I/R injury. ** $p < 0.01$; *** $p < 0.001$ versus Sham; † $p < 0.05$; ‡ $p < 0.01$ versus I/R ($n=6/group$) by one-way ANOVA. Error bars show means \pm SEM.

Figure S2. Echocardiographic parameters. Repeated measures two-way ANOVA was used for comparison of heart function within groups (sham - n=5, I/R - n=5, I/R+HC - n=6).

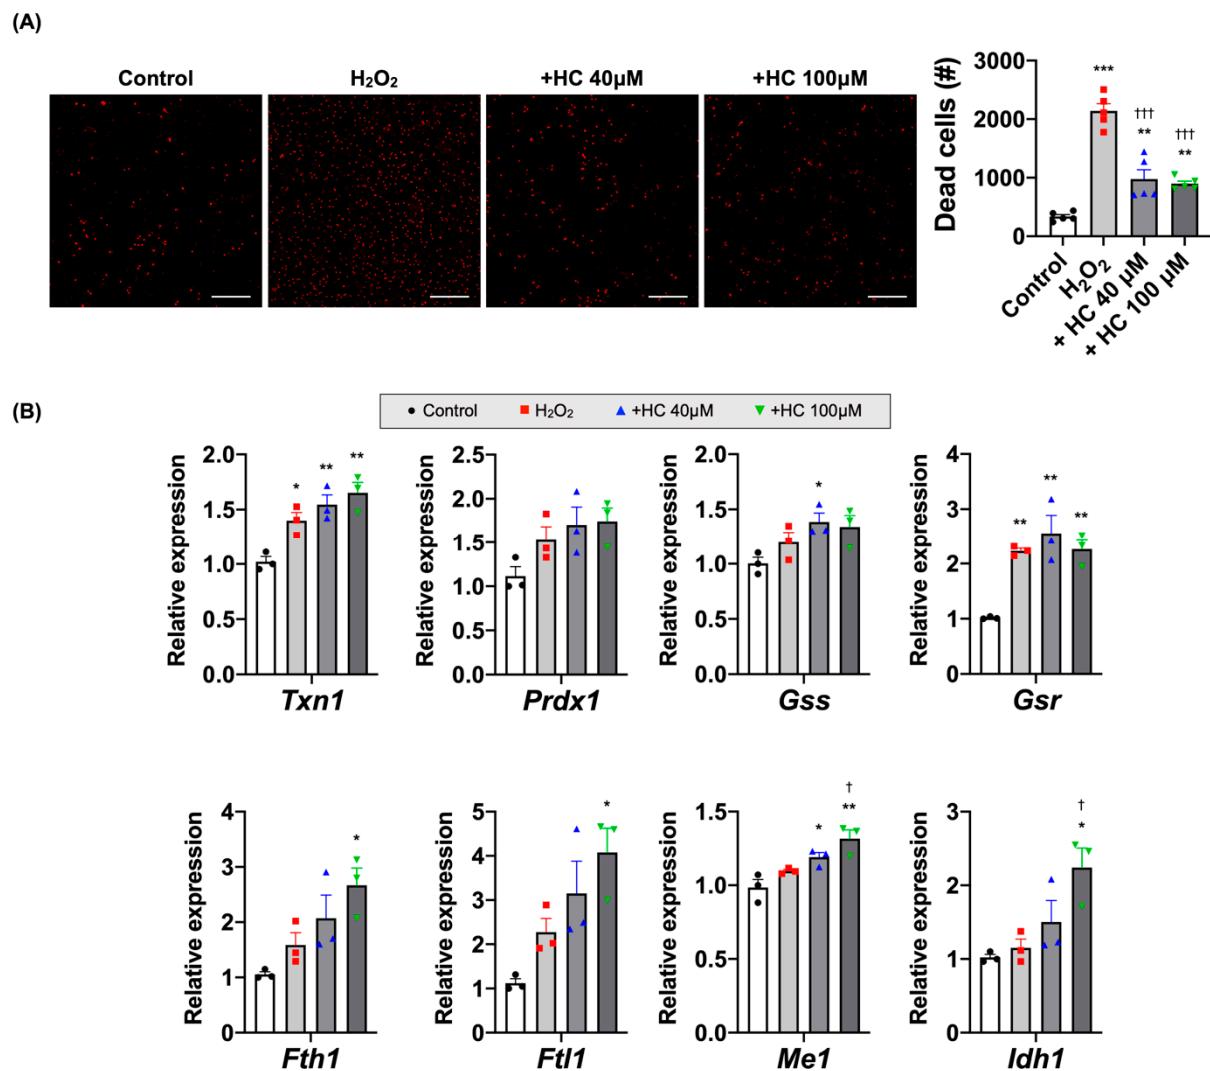

Figure S3. NRCMs treated with H₂O₂, associated with figure 4. (A) The representative images of Live/Dead analysis treated with H₂O₂ and quantitative analysis of dead cell number (red dot). ** p < 0.01; *** p < 0.001 versus Control; ††† p < 0.001 versus H₂O₂ (n= 5/group) by one-way ANOVA. Error bars show means ± SEM. Scale bar = 200 μm. (B) The relative mRNA expression level of antioxidant-related genes in NRCMs treated with H₂O₂. * p < 0.05; ** p < 0.01; versus Control; † p < 0.05; versus H₂O₂ (n= 3/group) by one-way ANOVA. Error bars show means ± SEM.

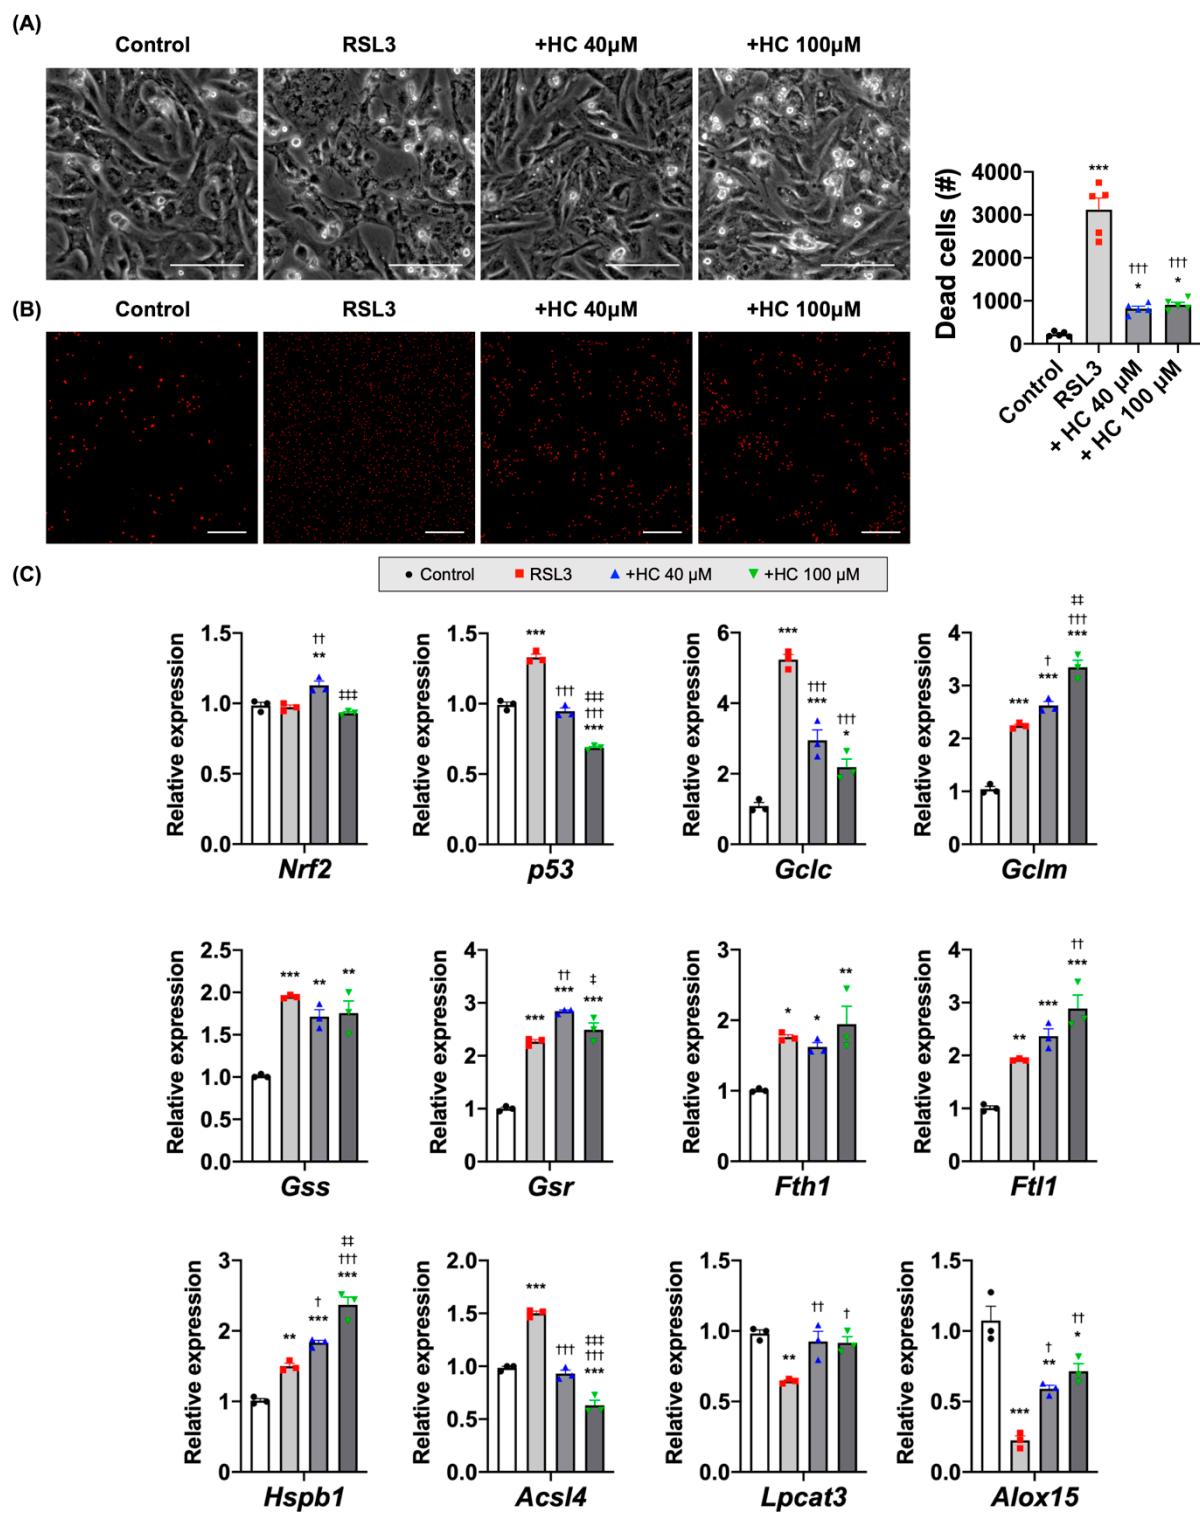

Figure S4. NRCMs treated with RSL3, associated with figure 5. (A) Optical microscope images of RSL3 induced ferroptotic cell death. Scale bar = 100 μ m. (B) The representative images of Live/Dead analysis treated with RSL3 and quantitative analysis of dead cell number (red dot). * $p < 0.05$; *** $p < 0.001$ versus Control; ††† $p < 0.001$ versus RSL3 ($n= 5$ /group) by one-way ANOVA. Error bars show means \pm SEM. Scale bar = 200 μ m. (C) The relative mRNA expression level of ferroptosis-related genes in NRCMs treated with RSL3. * $p < 0.05$; ** $p < 0.01$; *** $p < 0.001$; versus Control; † $p < 0.05$; †† $p < 0.01$; ††† $p < 0.001$; versus RSL3; ‡‡ $p < 0.01$; ‡‡‡ $p < 0.001$ versus +HC 40 μ M ($n= 3$ /group) by one-way ANOVA. Error bars show means \pm SEM.

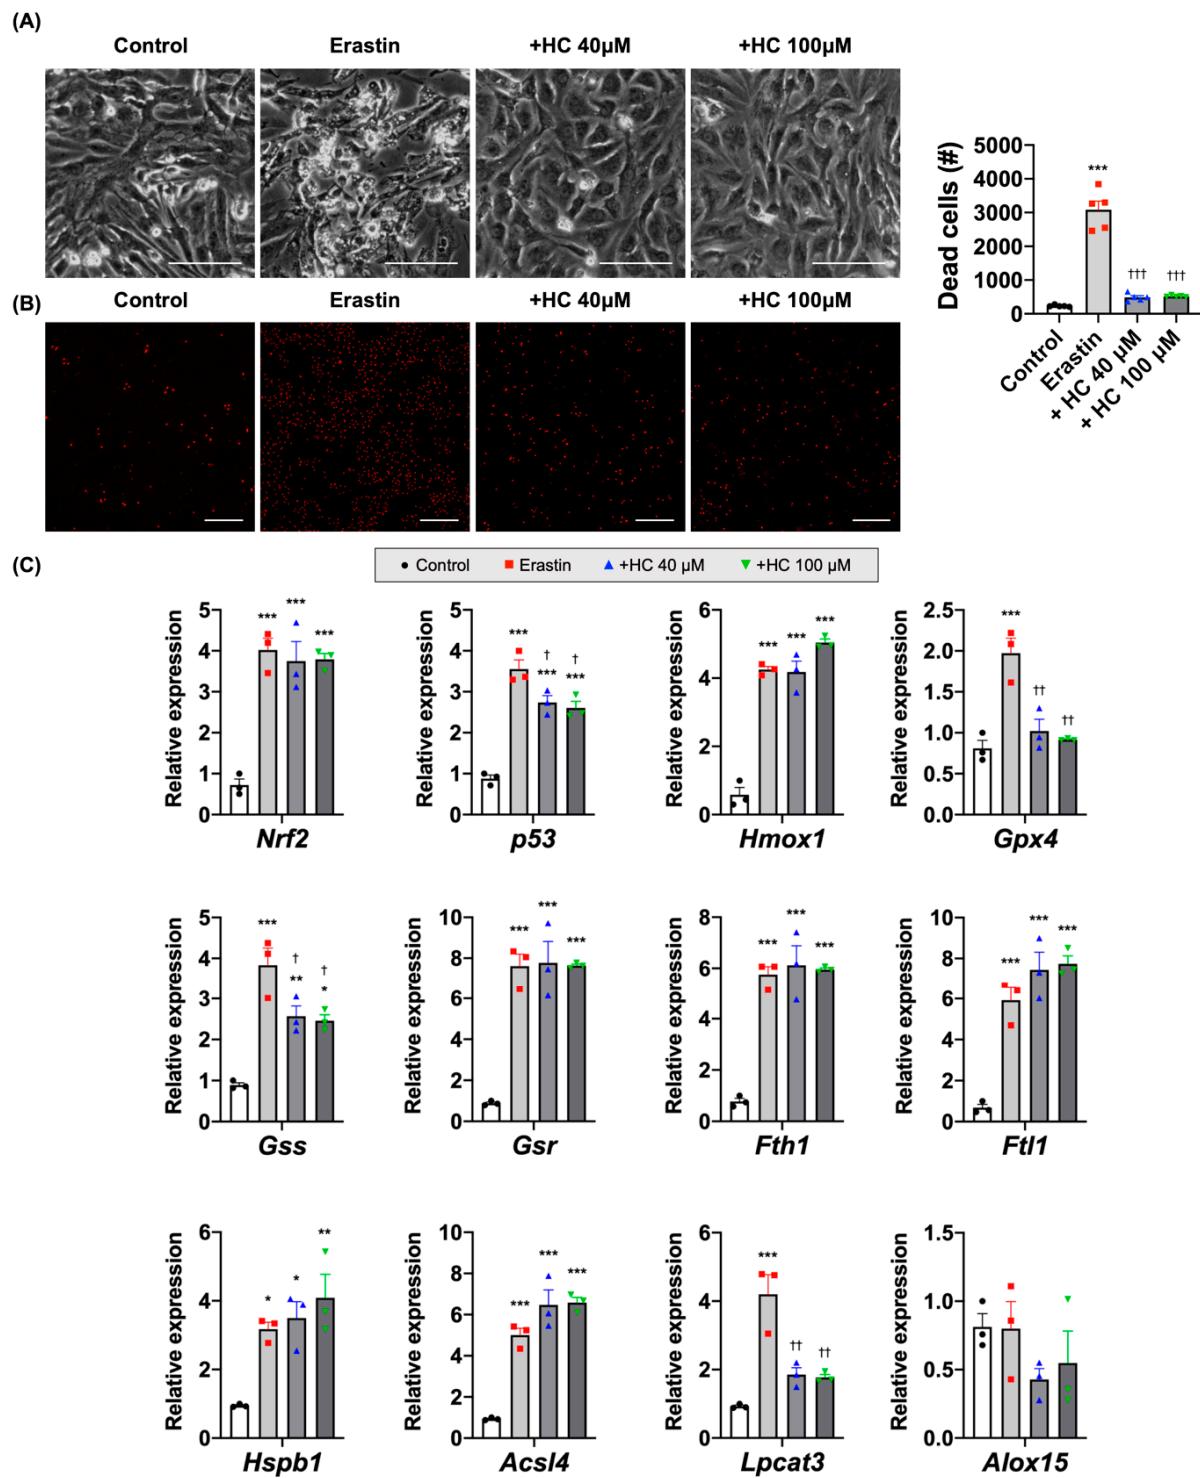

Figure S5. NRCMs treated with elastin, associated with figure 6. (A) Optical microscope images of elastin induced ferroptotic cell death. Scale bar = 100 μ m. (B) The representative images of Live/Dead analysis treated with elastin and quantitative analysis of dead cell number (red dot). * p < 0.05; ** p < 0.01; *** p < 0.001 versus Control; ††† p < 0.001 versus Elastin (n= 5/group) by one-way ANOVA. Error bars show means \pm SEM. Scale bar = 200 μ m. (C) The relative mRNA expression level of ferroptosis-related genes in NRCMs treated with elastin. * p < 0.05; ** p < 0.01; *** p < 0.001; versus Control; † p < 0.05; †† p < 0.01; versus Elastin (n= 3/group) by one-way ANOVA. Error bars show means \pm SEM.

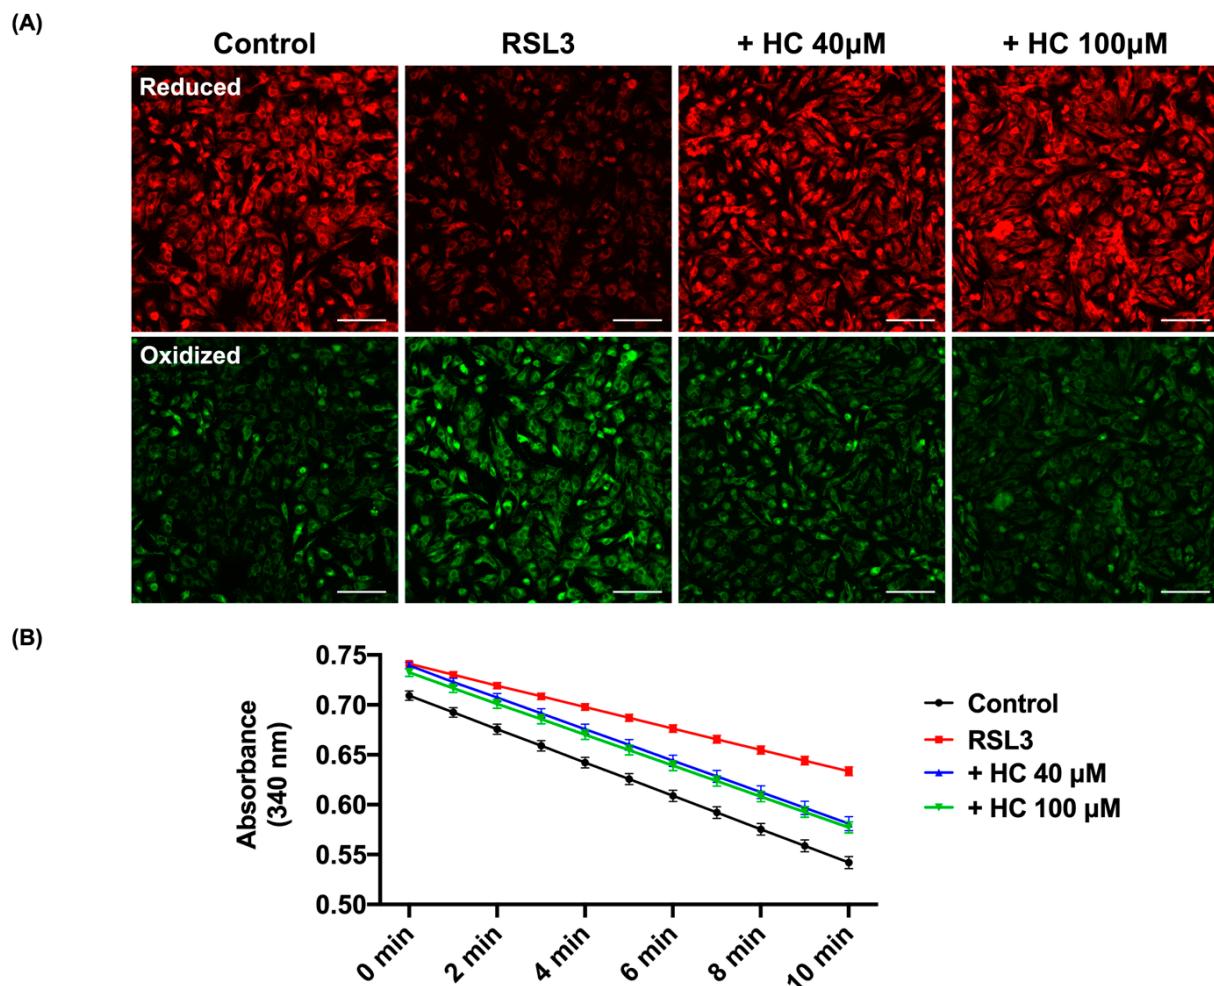

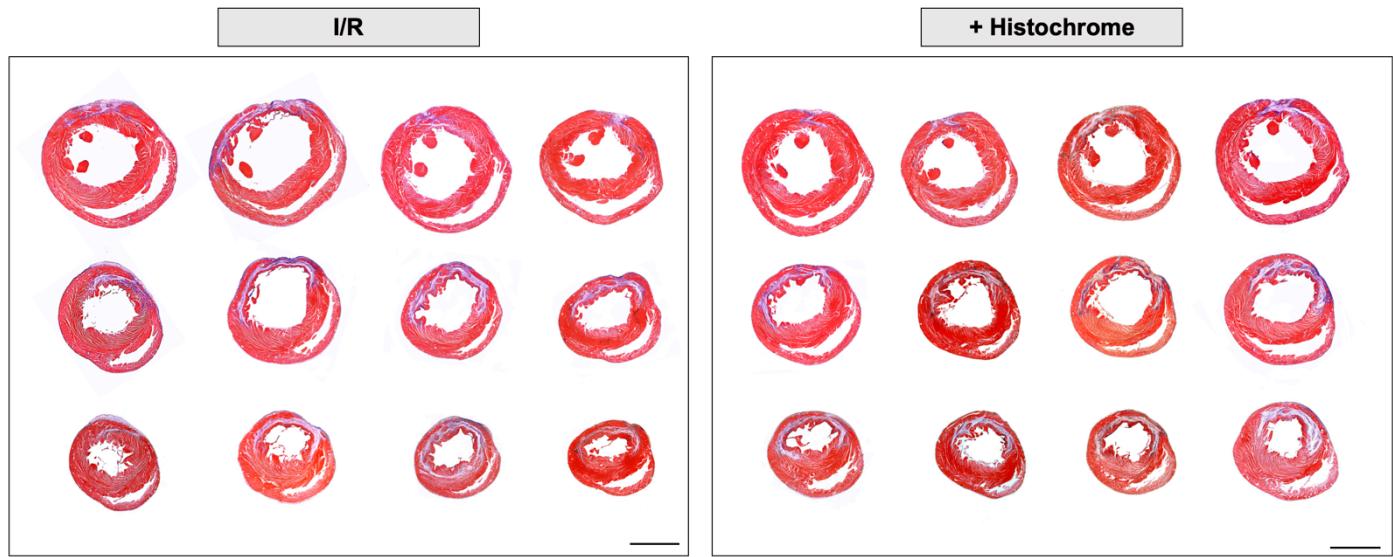

Figure S6. Measurement of lipid peroxidation and GPx activity. (A) The fluorescence of BODIPY 581/581 C11 was measured by the acquisition of green (oxidized) and red (reduced) signals, providing a ratiometric indication of lipid peroxidation. (B) For measurement of GPx activity, the absorbance was read at a wavelength of 340 nm for 10 min at 1 min intervals.

(A)

(B)

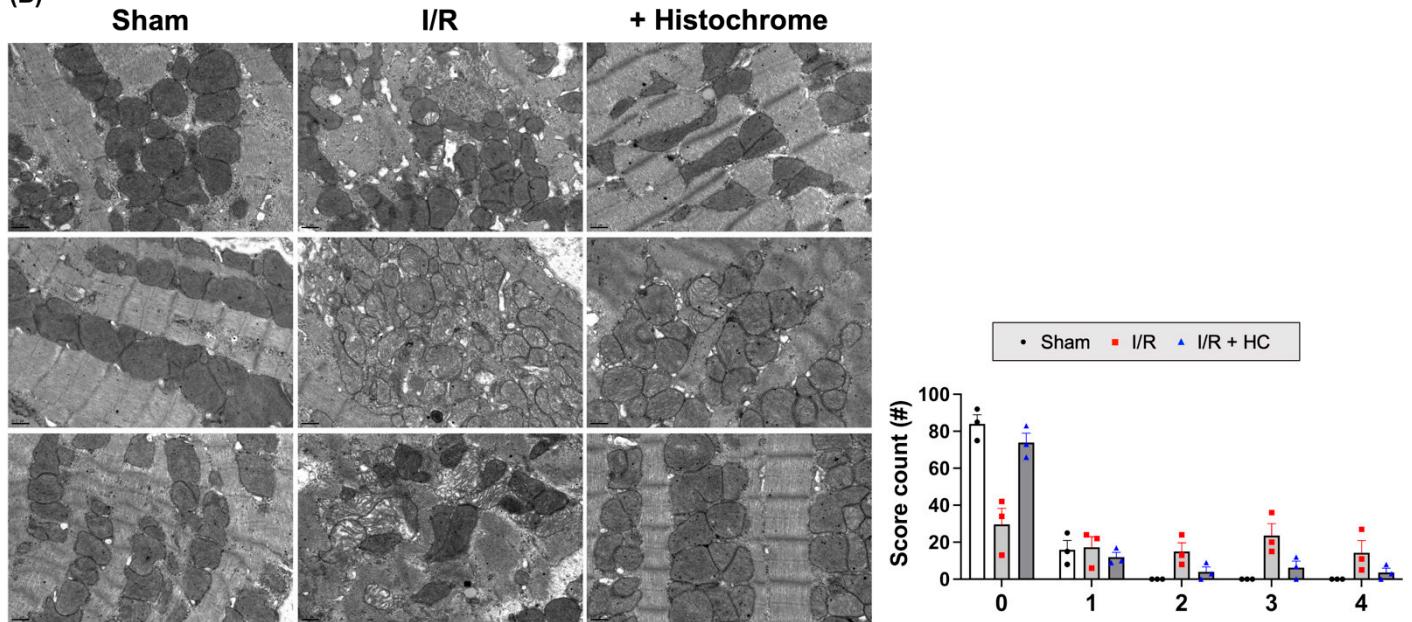

Figure S7. The representative images of Masson's trichrome (MT) staining and evaluation of mitochondrial damage. (A) Representative images of MT stained infarct heart 4 weeks after I/R injury and treated with HC injection. Scale bar = 4000 μ m. (B) The representative transmission electron microscopic (TEM) images of each group. Scale bar = 0.5 μ m. Stages of mitochondrial reaction following I/R injury. Score 0 - normal structure with preserved mitochondrial granule, Score 1 - normal structure but granules absent, Score 2 - mitochondrial swelling, Score 3 - disruption of mitochondrial crests, Score 4 - disruption of the crests and loss of integrity of the mitochondrial membrane.
