

Figure S1. Expression of Th cell differentiation related genes in intestine, spleen, head kidney and peripheral blood leukocytes (PBLs) after inactivated *Vibrio anguillarum* immunization. Results are shown as means \pm SD (N = 3). Different letters on the bar represent the statistical significance ($P < 0.05$) of difference between the experimental (6, 12, 24 and 48 hours after immunization) and control groups (0 hour after immunization).
