

## SUPPLEMENTARY DATA

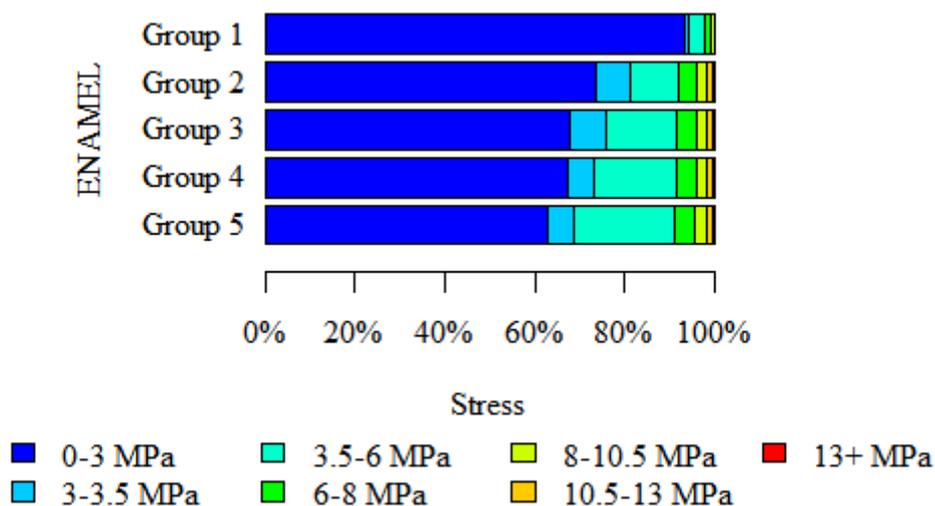

The following supplementary data provide a quantitative analysis of the stress distributions calculated on the different stress distribution maps (see the main text for a detailed description). On each table, data have been arranged on the basis of the stress-rank (rows) and of the experimental/control Group (columns) and the numbers indicate the surface extension of each stress-rank, given as the absolute count of pixels on each map digital image (and as the pixel percentage of the whole map surface). Statistical analyses were performed by using chi-squared tests (with Yates' correction for 2x2 tables) or Fisher's exact tests (when low expected values occurred) in order to assess the effect of the belonging "experimental/control group" on the spatial extension of each particular stress-rank. The level of  $\alpha$  was set at 0.05 and the results of the statistical tests have been indicated in the tables. The surface extensions of each stress-rank (in each different group) have been also graphically summarized in bar charts. Data are presented considering separately each different restorative material.

### 1 Data for the mid buccal-palatal plane maps, along the tooth long axis.

#### 1.1 MATERIAL: Enamel Plus Biofunction (Micerium, Avegno, Italy)

Stress-rank	Group					p
