# Controlled Crystal Growth of All-Inorganic CsPbI<sub>2.2</sub>Br<sub>0.8</sub> Thin Film via Additive Strategy for Air-Processed Efficient Outdoor/Indoor Perovskite Solar Cells

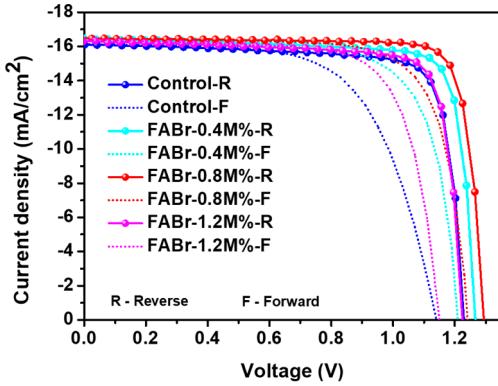

**Fig. S1** Schematic demonstration of fabrication procedure of perovskite solar cells.

**Fig. S2** XPS patterns of (a) Cs 3d, (b) Pb 4f, (c) I 3d, (d) Br 3d, and (e) N 1s of 100 °C and 240 °C FABr-0.8M% annealed perovskite films.

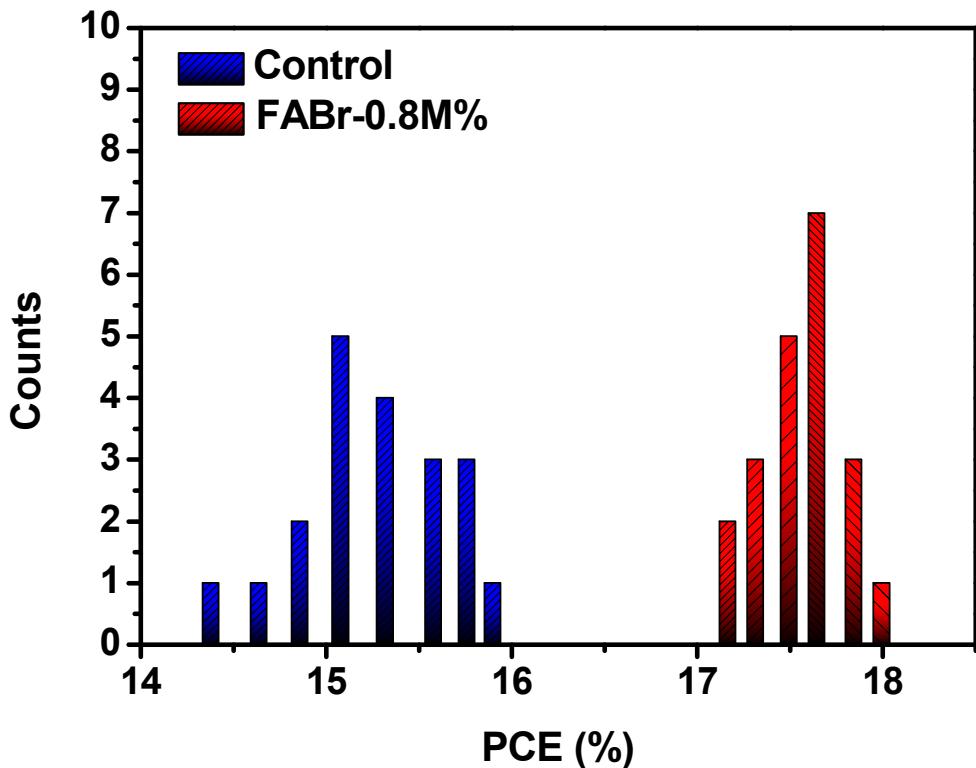

**Fig. S3** XPS patterns of (a) Cs 3d, (b) Pb 4f, (c) I 3d, (d) Br 3d, and (e) N 1s of 240 °C FABr-0.8M% annealed perovskite film and after etching the surface through Ar ion etching gun.

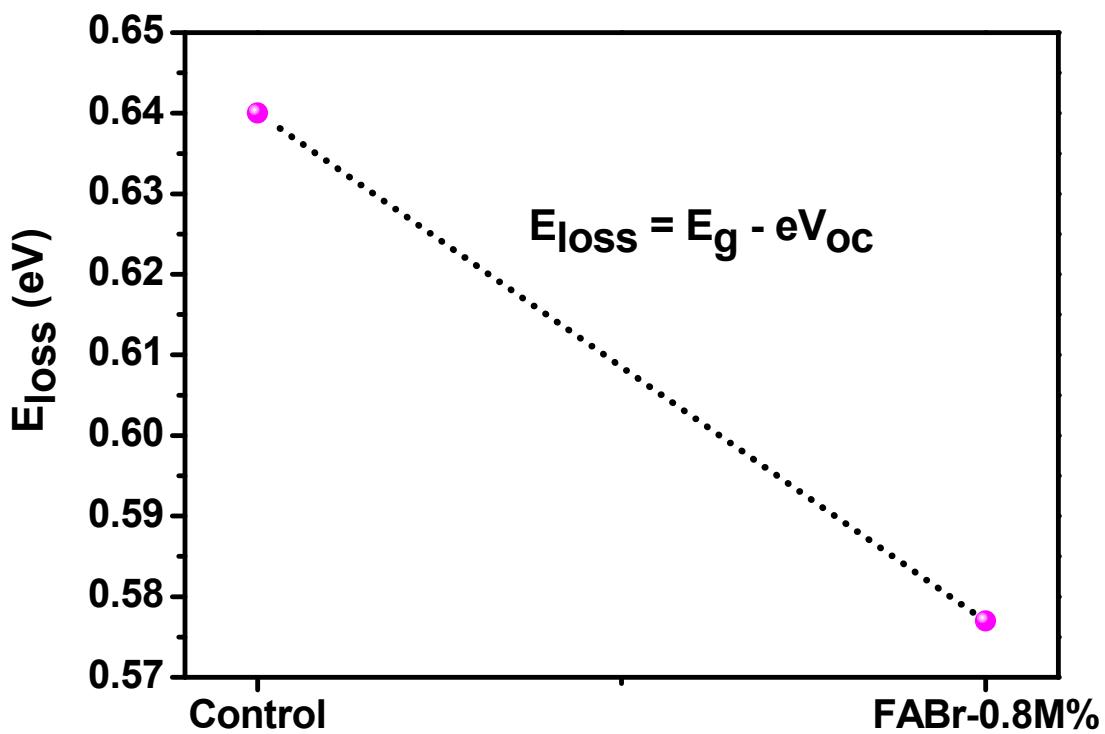

**Fig. S4** JV curves of control, FABr-0.4M%, FABr-0.8M% and FABr-1.2M% based PSCs.

The hysteresis index ( $HI$ ) was calculated using the following formula [S1] and obtained values were tabulated in Table S4.

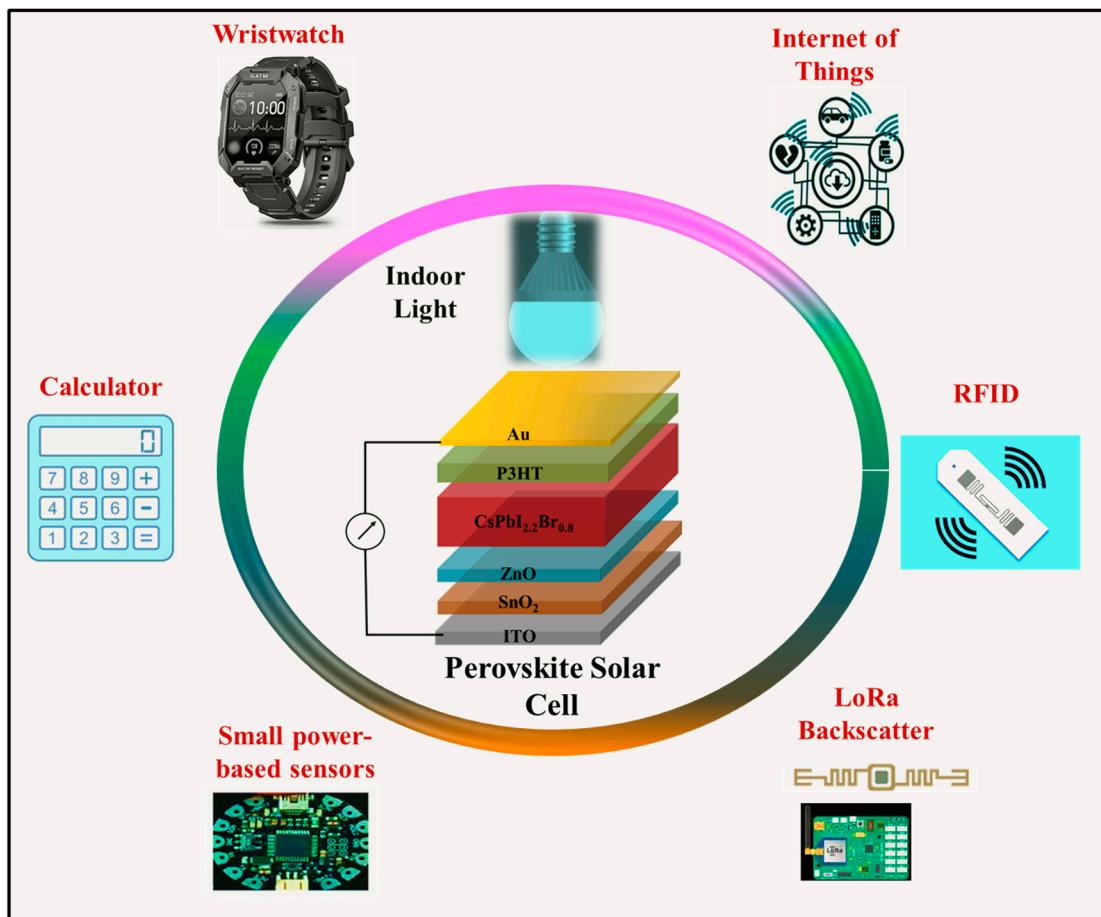

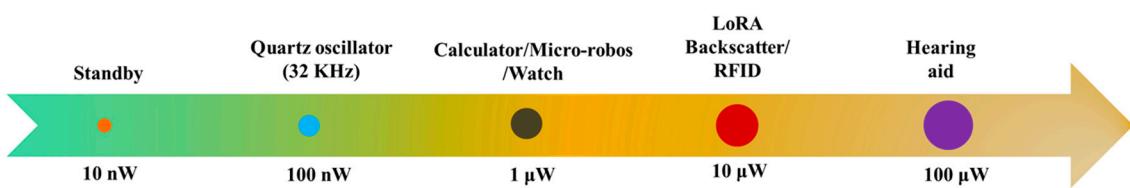

$$HI = \frac{PCE_{(reverse)} - PCE_{(forward)}}{PCE_{(reverse)}}$$

**Fig. S5** PCEs distribution histograms for control and FABr-0.8M% based PSCs.

**Fig. S6** Energy loss corresponding to control and FABr-0.8M% based PSCs.

**Fig. S7 (a)** Power consumption of various electronic devices, and **(b)** Electronic applications for indoor perovskite solar cells.

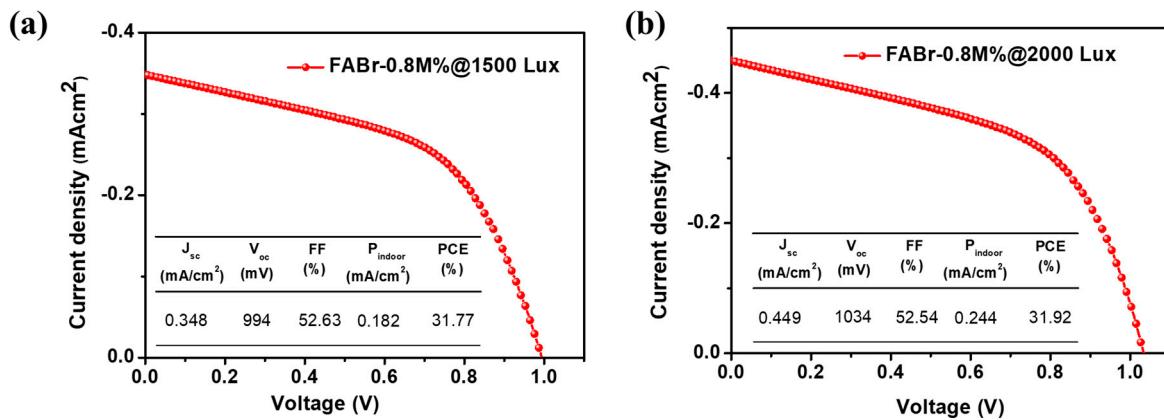

Fig. S8: JV curves of optimized PSC at (a) 1500 lux and (b) 2000 lux. The inset table shows the corresponding indoor photovoltaic parameters.

**Table S1** Reported research studies on CsPb<sub>2.25</sub>Br<sub>0.75</sub> perovskite composition.

Reference with device structure	Methodology	Novelty Statement	Processing conditions	PCE (%)	
				Out-door	In-door
ITO/ZnO:DPPA/CsPbI <sub>2.25</sub> Br <sub>0.75</sub> /PTAA/MoO <sub>3</sub> /Au [S2]	Surface modification of ETL layer	Authors suggested that ZnO surface defects significantly reduced with DPAA treatment, which is beneficial to formation of high-quality perovskite film.	N <sub>2</sub> -filled glovebox	15.90	-
ITO/SnO <sub>2</sub> / CsPb(I <sub>0.75</sub> Br <sub>0.25</sub> ) <sub>3</sub> -0.5FAAc:CTAC/ Spiro-OMeTAD/Au [S3]	Surface passivation strategy	Authors demonstrated that hexadecyltrimethylammonium chloride (CTAC) treatment efficiently passivated the perovskite surface, resulting in improved the device PCE as well as stability.	RH-10%	18.05	-

ITO/SnO <sub>2</sub> /ZnO/CsPbI <sub>2.25</sub> Br <sub>0.75</sub> / PBD2T:PTAA/MoO <sub>3</sub> /Ag [S4]	Additive strategy with HTL layer	Authors suggested that addition of donor polymer PBD2T into PTAA facilitate suitable band energy alignment corresponding to perovskite, resulting in reduced energy losses.	N <sub>2</sub> filled glovebox	17.37	-
ITO/SnO <sub>2</sub> /ZnO/CsPbI <sub>2.25</sub> Br <sub>0.75</sub> : Pb(Ac) <sub>2</sub> .3H <sub>2</sub> O/PTAA/MoO <sub>3</sub> /Ag [S5]	Drop-coating strategy	Authors suggested that lead acetate trihydrate as an additive into perovskite precursor and airflow drying controlled the nucleation and crystal growth, leading to high quality of perovskite film.	Ambient conditions	18.49	-
<b>&lt;This work&gt;</b>					
ITO/SnO <sub>2</sub> /ZnO/CsPbI <sub>2.2</sub> Br <sub>0.8</sub> :FA Br /P3HT/Au	Additive strategy with perovskite composition	Authors demonstrated that FABr as an additive plays key role to retard the crystallization kinetics and control the crystal growth by limiting the formation of nuclei centers, resulting in improved film quality. The FABr assisted device showed high PCE as well as good long-term stability as compared to control PSC.	Ambient air (RH ~ 30- 40%)	17.95	31.22

**Table S2** Crystal lattice parameters of corresponding to (100) and (200) planes for control and FABr-0.8M% perovskite thin films.

Parameters	Control (100)	FABr-0.8M% (100)	Control (200)	FABr-0.8M% (200)	Average	
					Control	FABr-0.8M%
Full width at half maximum ( $\beta$ , °)	0.1775	0.1126	0.2085	0.1860	0.1930	0.1493
Peak angle ( $2\theta$ , °)	14.72	14.70	29.58	29.57	-	-
Average crystallite size ( $D$ , nm)	45.12	71.13	39.40	44.10	42.26	57.61
Strain ( $\varepsilon$ )	0.2834	0.1802	0.1629	0.1450	0.2231	0.1626
Dislocation density ( $\delta$ , nm $^{-2}$ )	-	-	-	-	$5.56 \times 10^{-4}$	$3.01 \times 10^{-4}$

**Table S3** TRPL fitted parameters for control and FABr-0.8M% perovskite thin films. The TRPL parameters was fitted using the biexponential decay model.

Perovskites	$\tau_1$ (ns)	$A_1$ (%)	$\tau_2$ (ns)	$A_2$ (%)	$\tau_{avg}$ (ns)
Control	29.90	18.73	87.49	81.27	83
FABr-0.8M%	49.65	19.34	132.71	80.66	125

**Table S4** Photovoltaic parameters of control and FABr different concentrations (0.4, 0.8, and 1.2M%) based PSCs.

Devices	$J_{SC}$ (mA/cm <sup>2</sup> )	$V_{OC}$ (mV)	$FF$ (%)	$FF$ (%)	$PCE$ (%)	$HI$ (%)
Control-R	16.10	1230	80.51	80.51	15.94	
Control-F	16.15	1140	63.94	63.94	11.77	26.16
FABr-0.4M%-R	16.42	1265	82.44	82.44	17.12	
FABr-0.4M%-F	16.43	1209	72.85	72.85	14.47	15.47
FABr-0.8M%-R	16.46	1293	84.36	84.36	17.95	
FABr-0.8M%-F	16.46	1241	75.05	75.05	15.33	14.59
FABr-1.2M%-R	16.33	1224	81.22	81.22	16.23	
FABr-1.2M%-F	16.38	1150	72.64	72.64	13.68	15.71

**Table S5** Nyquist parameters of the control and FABr-0.8M% based PSCs.

Parameters	Control	FABr-0.8M%
$R_s$ ( $\Omega$ )	55	43
$R_{rec}$ ( $\Omega$ )	6478	9706
