

Supplementary Figure 1: ICAM-1 and MHC Class I expression in HUVEC after incubation with IFN- γ alone or in combinations with 8-CPT cGMP for 48 h. Mean Fluorescence Intensity (expressed as mean \pm SEM fold increase over MFI of untreated cells), for (A) ICAM-1, (B) MHC Class I on untreated HUVEC or after 48 h treatment with IFN- γ alone or in combination with 8-CPT-cGMP; $n = 3$ HUVEC isolates (** $p < 0.01$, significantly different from IFN- γ alone).
