

SUPPLEMENTARY INFORMATION FILES

S1. Table with secondary PK parameters of enrofloxacin in broilers and their associated standard error (SE), coefficient of variation (CV%) and 95% confidence intervals

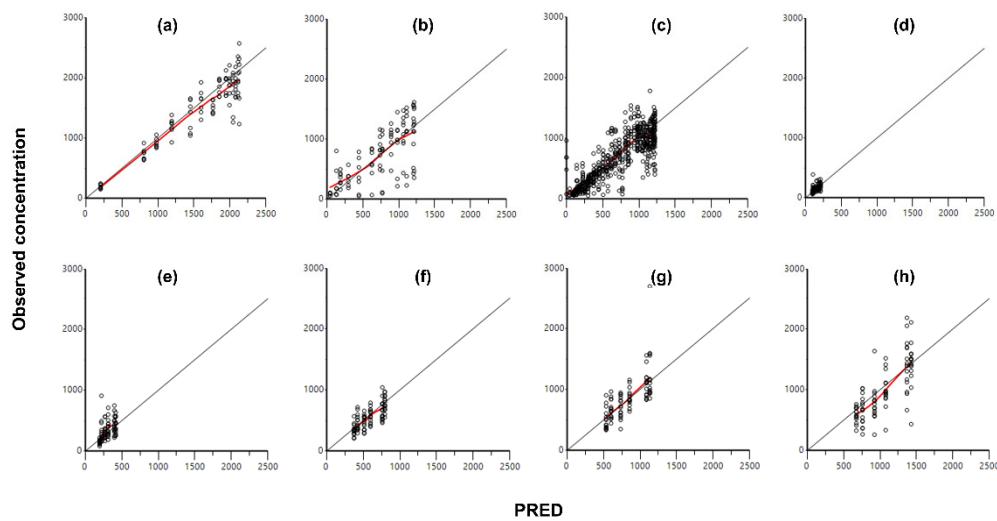

Secondary parameters	Estimate	Units	SE	CV%	2.5% CI	97.5% CI
K _e	0.098	1/h	0.004	4.365	0.090	0.106
T _{max}	3.312	h	0.142	4.290	3.033	3.591
AUC _(0-inf)	21830.100	h*ng/mL	1410.230	6.460	19061.749	24598.451
C _{max}	1546.870	ng/mL	110.586	7.149	1329.784	1763.956
T _{1/2 absorption}	1.012	h	0.076	7.496	0.863	1.161
T _{1/2 elimination}	7.069	h	0.309	4.365	6.464	7.675

Figure S2. Scatterplots of observed concentrations vs. IPRED

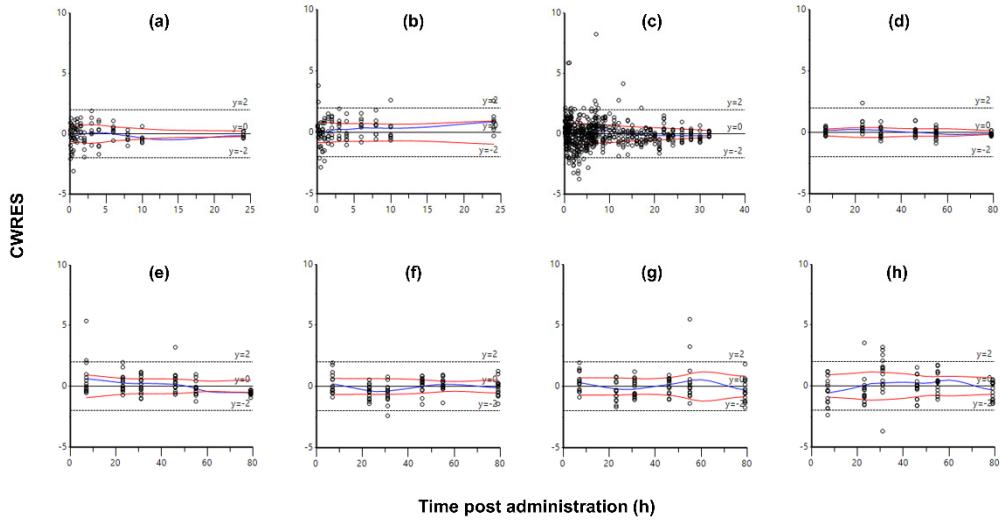

Diagnostic scatterplots of the dependent variable (i.e. the observed concentrations) vs. the individually predicted plasma concentration values (IPRED) on arithmetic scale of the different treatment groups ($a = IV$, $b = PO$ richly sampled, $c = PO$ sparsely sampled, $d =$ drinking water administration $2.5 \text{ mg/kg}/24\text{h}$, $e =$ drinking water administration $5 \text{ mg/kg}/24\text{h}$; $f =$ drinking water administration $10 \text{ mg/kg}/24\text{h}$, $g =$ drinking water administration $15 \text{ mg/kg}/24\text{h}$ obtained and $h =$ drinking water administration $20 \text{ mg/kg}/24\text{h}$). The black circles represent the observed data, the full black lines are the lines of unity and the red line represents the LOESS line.

Figure S3. Scatterplots of observed concentrations vs. PRED

Diagnostic scatterplots of the dependent variable (i.e. the observed concentrations) vs. the predicted plasma concentration values PRED on arithmetic scale of the different treatment groups ($a = IV$, $b = PO$ richly sampled, $c = PO$ sparsely sampled, $d =$ drinking water administration $2.5\text{ mg/kg}/24\text{h}$, $e =$ drinking water administration $5\text{ mg/kg}/24\text{h}$; $f =$ drinking water administration $10\text{ mg/kg}/24\text{h}$, $g =$ drinking water administration $15\text{ mg/kg}/24\text{h}$ obtained and $h =$ drinking water administration $20\text{ mg/kg}/24\text{h}$). The black circles represent the observed data, the full black lines are the lines of unity and the red line represents the LOESS line.

Figure S4. Scatterplots of CWRES vs. time post administration

Diagnostic scatterplots of the conditionally weighted residuals (CWRES) vs. time after dose (independent variable, IVAR) of the different treatment groups (a = IV, b = PO richly sampled, c = PO sparsely sampled, d = drinking water administration 2.5 mg/kg/24h, e = drinking water administration 5 mg/kg/24h; f = drinking water administration 10 mg/kg/24h, g = drinking water administration 15 mg/kg/24h obtained and h = drinking water administration 20 mg/kg/24h).

Values of CWRES should be concentrated heavily between $y = -2$ and $y = 2$. The blue LOESS lines give the overall tendency of the residuals and the red LOESS lines should not show any fanning.

S5. Table of selected quantiles of the PTA analysis of the different doses for a range of MIC values. The dose where 90% of the population (90% quantile) reached the PK/PD target ($fAUC(48-72h)/MIC \geq 100$) for a particular MIC value was considered effective.

	MIC ($\mu\text{g/mL}$)	Quantiles (%)				
		25	50	75	90	95
Dose 2.5 mg/kg/24h: AUC(48-72)/MIC	0.032	130.774	116.699	99.793	85.769	76.598
	0.064	66.956	59.750	51.094	43.914	39.218
