

## Supplementary Materials

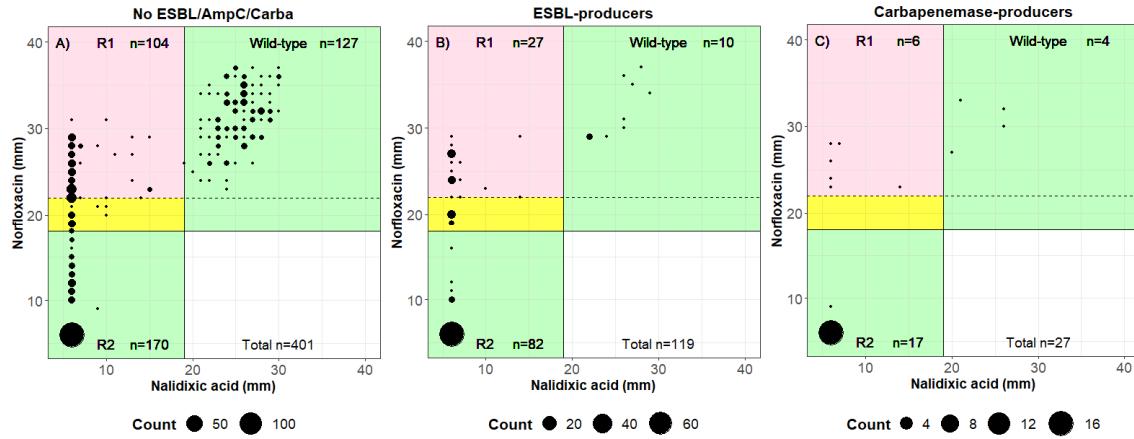

**Figure S1. Distribution of the inhibition diameters with WGS-based clinical categorization.** EUCAST lower and upper clinical breakpoints are indicated by the dashed and continuous black lines, respectively. EUCAST ECOFFs and IMM working cut-offs are indicated by the blue and red continuous lines, respectively. The coloured areas reflect the EUCAST clinical categories of susceptible (green), susceptible by increased exposure (yellow) and resistant (red). WT, wild-type; R1, Low-level resistance; R2, High-level-resistance.

**Figure S2. Inhibition zone diameters of isolates with discordant phenotype/genotype.** Dots indicate the inhibition zone diameters of isolates with discrepant QUIRMIA-derived resistance mechanism(s) and WGS-based genotype(s). Asterisks indicate the inhibition diameter responsible for the discrepancy, respectively. Vertical dashed lines indicate IMM working cut-off separators. WT, wildtype; R1, low-level resistance, R2, high-level resistance.

**Figure S3. Inhibition zone diameters of isolates with discordant genotype/phenotype.** Dots indicate the inhibition diameters of isolates with discrepancies regarding WGS-based predicted vs. observed phenotypes. Asterisks indicate the inhibition diameters responsible for the discrepancy, respectively. Vertical dashed lines indicate the IMM working cut-off separators. WT, wildtype; R1, low-level resistance, R2, high-level resistance.

**Figure S4. Inhibition zone diameter distributions of isolates grouped by  $\beta$ -lactamase production.**

Dots correspond to inhibition zone diameters for nalidixic acid and norfloxacin of A) isolates producing no ESBL or carbapenemases, B) ESBL-producers and C) carbapenemase-producers. Vertical and horizontal continuous lines indicate the IMI working cut-off separators for norfloxacin and nalidixic acid, respectively. Horizontal dashed lines indicate the EUCAST ECOFFs for norfloxacin. Green backgrounds reflect concordance between EUCAST- and WGS-based classification. Red and yellow backgrounds reflect isolates classified as low-level resistant based on WGS data and as susceptible or resistant according to EUCAST guidelines, respectively. R1, low-level resistance, R2, high-level resistance.

**Table S1. List of fluoroquinolone resistance mechanisms in *Escherichia coli*.**

Resistance mechanism(s)	Mechanism of action	Location of the gene(s)	Resistance phenotype
<i>qnr</i> [1-3]	Target protection	Plasmidic	Low-level resistance
AAC(6')-Ib-cr [4]	Drug inactivation	Plasmidic	Low-level resistance
<i>marR</i> mutations [5,6]	Drug efflux/descreased uptake	Chromosomal	Low-level resistance
<i>acrR</i> mutation [5,7]	Drug efflux	Chromosomal	Low-level resistance
<i>soxS</i> mutation [8]	Drug efflux	Chromosomal	Low-level resistance
<i>oqxAB</i> [9]	Drug efflux	Plasmidic	Low-level resistance
<i>qep</i> [10]	Drug efflux	Plasmidic	Low-level resistance
1 <i>gyrA</i> mutation [11]	Target modification	Chromosomal	Low-level resistance
1 <i>gyrA</i> mutation + 1 <i>parC</i> mutation [11]	Target modification	Chromosomal	Low-level resistance
2 <i>gyrA</i> mutations [11]	Target modification	Chromosomal	Low-level resistance
1 <i>gyrB</i> mutation [12]	Target modification	Chromosomal	Low-level resistance
2 <i>gyrA</i> mutations + 1 <i>parC</i> mutation [11]	Target modification	Chromosomal	High-level resistance
