--	-----------

Figure S1. PC371 in gene reporter assay. PC371 at high doses (512 and 1024µg/mL) did not decrease the Miller units. Data was collected from one experiment.

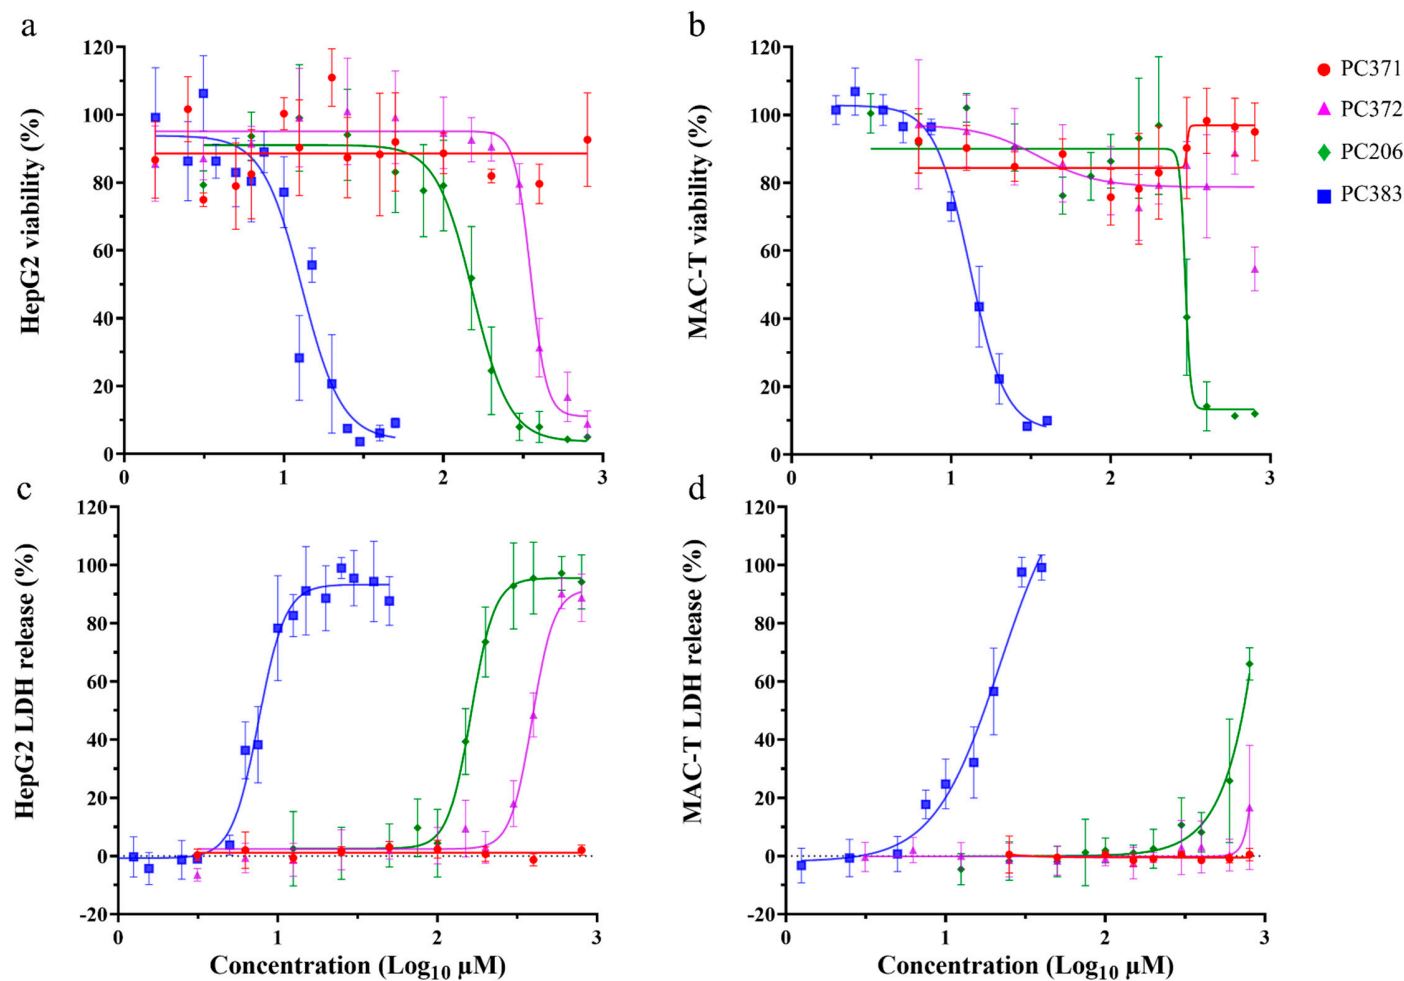

Figure S2. Measure of the CC_{50} using cells viability assays. MTT assay was done with HepG2 (a) and MAC-T (b) cells by increasing the concentration of pyrimidine compounds (PC371, PC372, PC206 and PC383). IC_{50} of at least two assays and three replicates' values were measured with Graph Pad prism 9.4.1. The same has been made with the LDH release assay with HepG2 cells (c), MAC-T cells (d).

Figure S3. Metabolic and plasmatic stability of PC206. Metabolic stability of PC206 was evaluated over a time period of 60 minutes. For the metabolic stability (a), 0.5 mg/mL of S9 CD-1 female mice liver fraction proteins were exposed to 10 μM of PC206. PC206's half-life was determined to be 83.3 minutes. Regarding the plasmatic stability (b), 10 μM of PC206 was exposed to CD-1 female mice plasma. For timepoints evaluated, PC206 is stable in plasma.

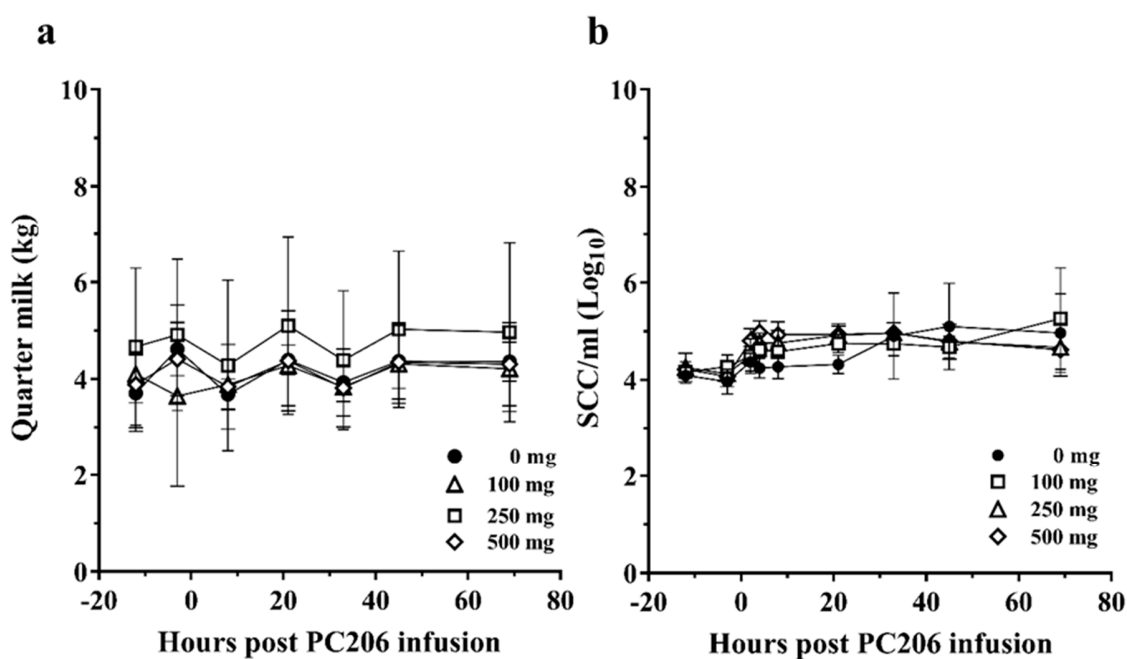

Figure S4. Safety assessment of PC206 in cows. Milk production (a) and somatic cell counts (SCC) (b) were measured as surrogate markers for the onset of inflammation 12 hours before and during 69 hours after PC206 IM infusion given immediately after the morning milking. Body temperature, SCC, quarter milk production and milk appearance did not differ significantly when comparing the three doses to the untreated control group (0 mg).
