

Supplementary Figure S1: Fly back pattern and subsequent ASCII commands utilized in the command file utilized for the XY array of Agilis LS-25-27 positioners. The blue rectangle with rounded corners is the 3D printed slide holder, gray rectangle is the slide (drawn to relative scale for 25mm by 75mm), with the black box representing the relative scale of the 27mm by 27mm travel range of the linear array. The ASCII commands functions are color coded blue, black, and red for the relative stage movement shown by the arrows and are as follows where 1 and 2 are the X or Y stages, and xx corresponds to an integer: 1SU-xx, set the negative step size of axis 1 to xx; 1MV-4, move to the negative limit (left limit switch) at the set step size; 1MV3, move to the positive limit switch at maximum step size and velocity after a set number of delays; 2SU-xx, set the negative step size of axis 2 to xx; 2PR-xxx, move axis two -xxx steps to the negative limit. Number of steps and step sizes for determination of average linear velocity must be calibrated prior to each run.

Supplementary Figure S2: Measurement of the pulled spray capillary by bright-field microscopy, each graduation in the scale bar is $10\mu\text{m}$. The final outer diameter (OD) of the tip was estimated at $35\mu\text{m}$ after measurement of pixels, the jet of solvent produced allowed estimation of the inner diameter (ID) at $30\mu\text{m}$. Images were captured using an AmScope 1.3MP USB camera and AmScope 3.7 software.

Supplementary Table S1: Annotations of species from the averaged MALDI and DESI-MSI, non-recalibrated from LIPIDMAPS, peaks with greater than 0.075% intensity were taken from the charge deconvolution in DataAnalysis 5.0 and searched with parameters of ± 0.1 Da as peaks were not internally recalibrated. The ionization source is indicated, observed mass, matched mass, delta change, annotation, name, and ionic formula are noted.
