

# Scores and amplitudes tables

October 17, 2012

## Contents

<b>1</b>	<b>Relative expression scoring sorted by amplitudes</b>	<b>1</b>
1.1	Matches relating TGF $\beta$ /contr 24h . . . . .	2
1.2	Matches relating full time control . . . . .	11
1.3	Matches relating full time TGF $\beta$ . . . . .	20
1.4	Matches relating control 1/6h vs. 6/24h . . . . .	29
1.5	Matches relating TGF $\beta$ /contr 6h vs. 24h . . . . .	46
1.6	Matches relating TGF $\beta$ /contr 6h . . . . .	63
<b>2</b>	<b>Amplitude differences in relative expression scoring</b>	<b>72</b>
2.1	Amplitude differences: Treatment difference . . . . .	72
2.2	Amplitude differences: Treatment difference . . . . .	89
2.3	Amplitude differences: Period difference, control . . . . .	106
2.4	Amplitude differences: TGF $\beta$ /contr 6h vs. 24h . . . . .	123
<b>3</b>	<b>Amplitudes with opposite signs</b>	<b>140</b>
3.1	Amplitude reversal of Treatment difference . . . . .	140
3.2	Amplitude reversal of Period difference, control . . . . .	146
3.3	Amplitude reversal of Period difference, TGF $\beta$ . . . . .	152

## 1 Relative expression scoring sorted by amplitudes

The scores in this chapter are based on the difference of two expression profiles. As opposed to the absolute expression profiles these profiles contain negative and positive values. Thus, the sign of the fluxes in the reference profile also matters.

Critical to the scoring of the relative profiles is the estimation of the scaling factor between the flux profile and the reference flux distribution. This is completely different from absolute scoring, there is an threshold range below which a gene is turned off, above which it is turned on. Consequently, the scaling factor is fixed for the absolute scoring. For the relative scoring, it must be flexible. The biochemically most important distinction is between positive and negative scaling factors: a negative scaling represents a downregulation of the respective function, whereas a positive scaling factor represents upregulation. Also the absolute value of the scaling factor can be telling. The larger it is, the larger the amount of up resp. downregulation with respect to a unit flux distribution. Therefore it is called amplitude here — it is a measure of the strength of the regulation. The tables show the simulations ordered by the amplitudes: in the left panel the top half of the functions in descending order, in the right panel the other half in ascending order.

### List of compartments

Identifier	compartment	comment
s	sinusoid (blood)	external
b	bile	external
c	cytosol	
m	mitochondrium	
r	ER and Golgi	combined
p	peroxysome	
l	lysosome	
n	nucleus	

## 1.1 Matches relating TGF $\beta$ /contr 24h

Table 1: Matches relating TGF $\beta$ /contr 24h

Top down, T24h higher Simulation	ampl	score	Bottom up, C24h higher Simulation	ampl	score
374 Collagen COFA1(c) synthesis	2.27	1	448 Ethanol degr	-3.56	0.54
