**Supplementary Figure S1:** Metabolites indicated by FIE-MS in negative ionisation mode that discriminate between lung squamous cell carcinoma and pair histologically normal tissue mapped on KEGG whole metabolism maps. The most significant compounds are indicated with light blue nodes.

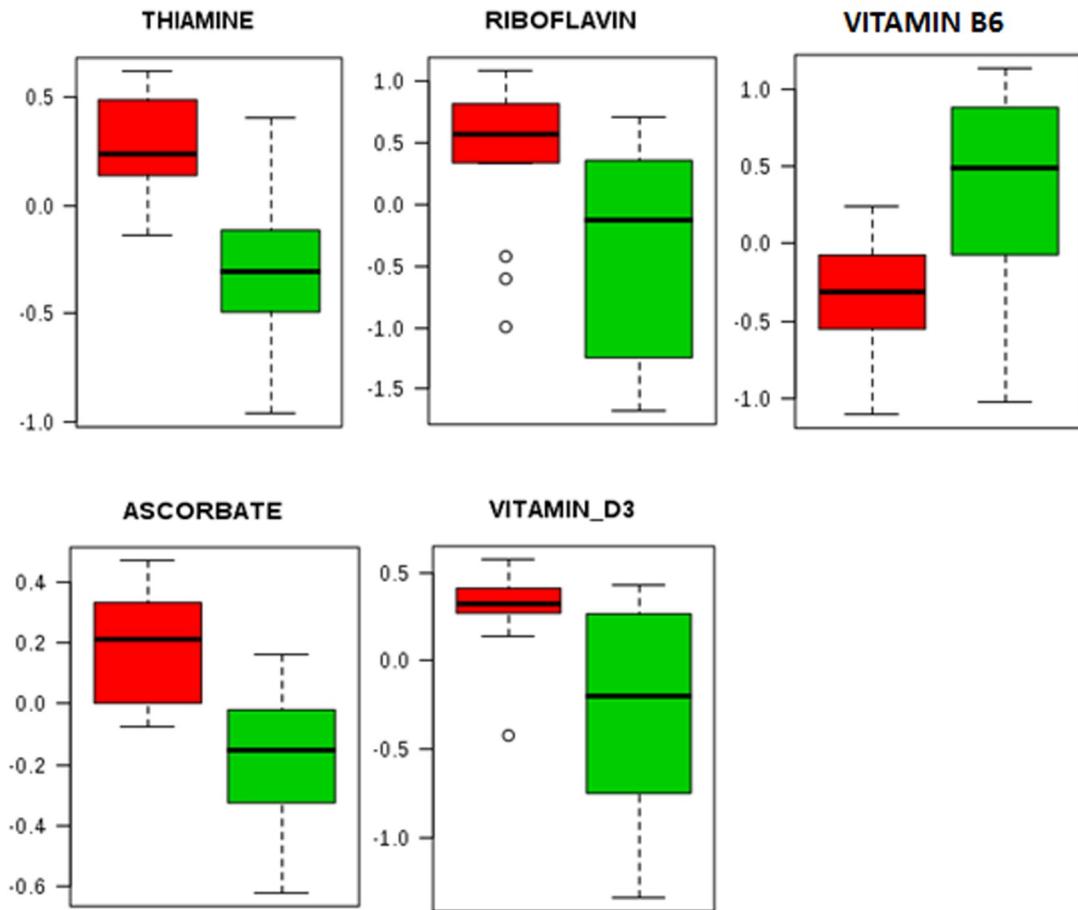

**Supplementary Figure S2:** Metabolites indicated by FIE-MS in positive ionisation mode that discriminate between lung squamous cell carcinoma and pair histologically normal tissue mapped on KEGG whole metabolism maps. The most significant compounds are indicated with pink nodes.

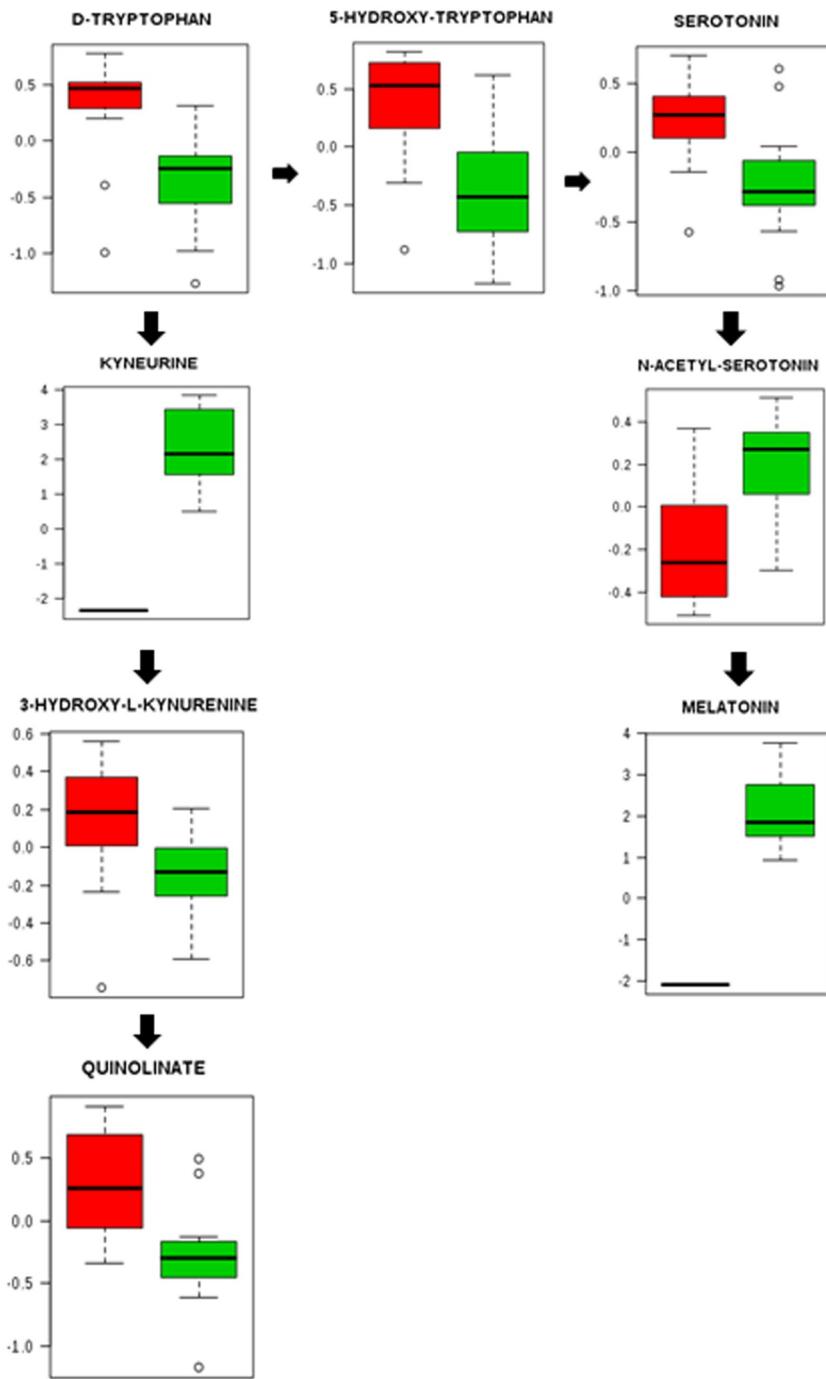

**Supplementary Figure S3:** TCA metabolite accumulation in lung squamous cell carcinoma (SCC) and paired samples (A) plotted as relative levels (only  $\alpha$ -ketoglutarate; boxed in red, was significantly increased in SCC tissue) or (B) compared using hierarchical cluster analysis. No SSC associated clustering was observed.

**(A) Steroid biosynthesis****(B) Lipid radical scavenging**

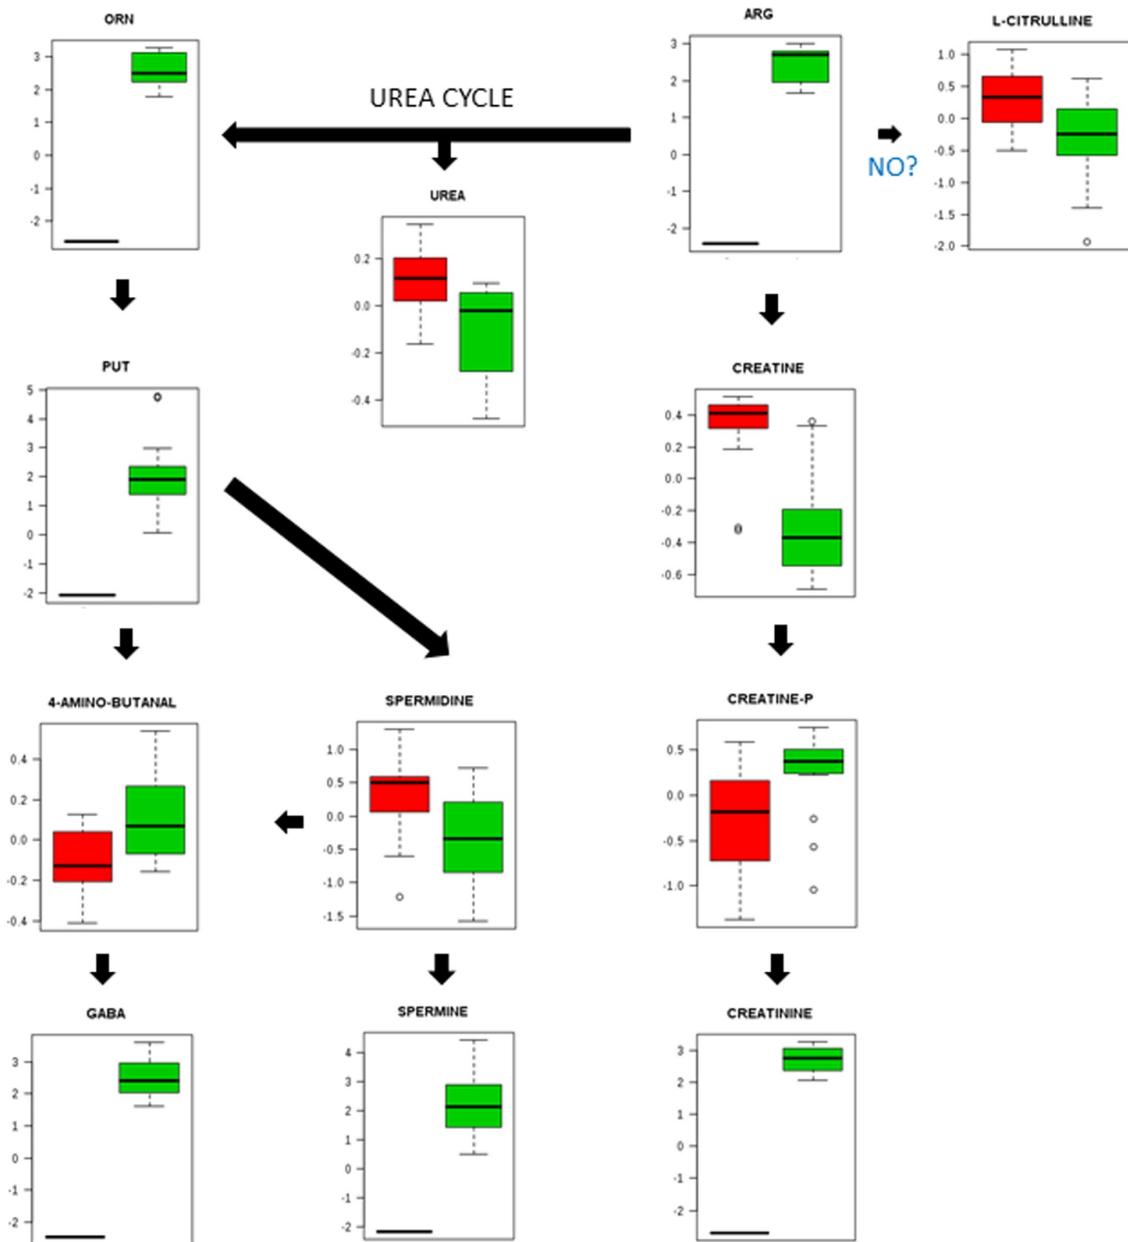

**Supplementary Figure S4:** Membrane associated metabolites significantly increased in lung SCC samples (red) versus paired histologically normal controls (green).

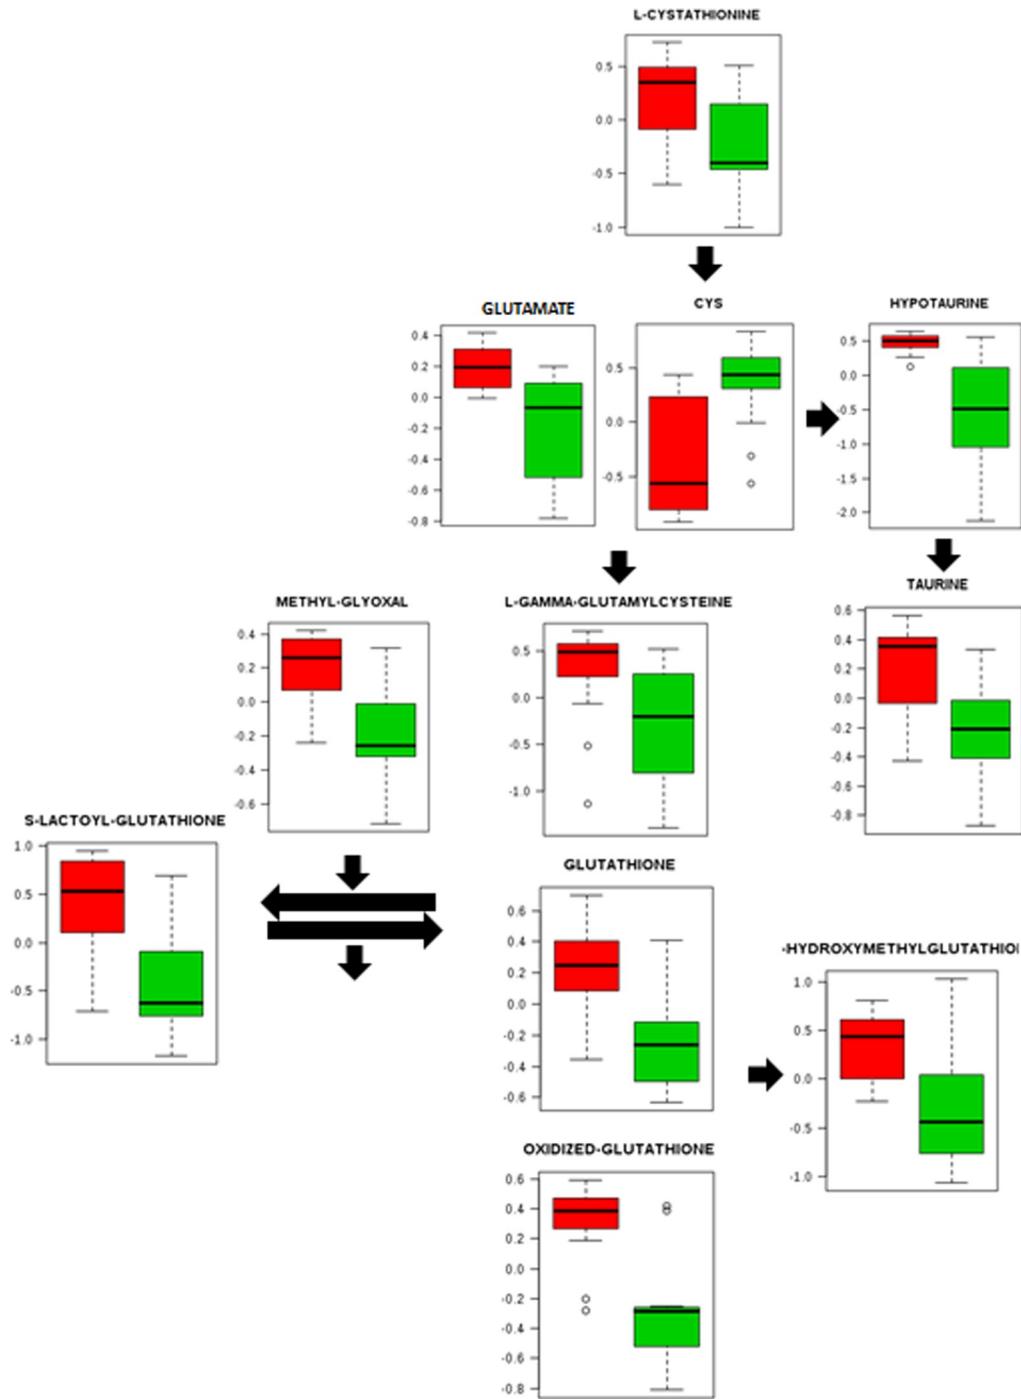

**Supplementary Figure S5:** Vitamin and Enzyme co-factor increases in lung SCC samples (red) versus paired histologically normal controls (green).

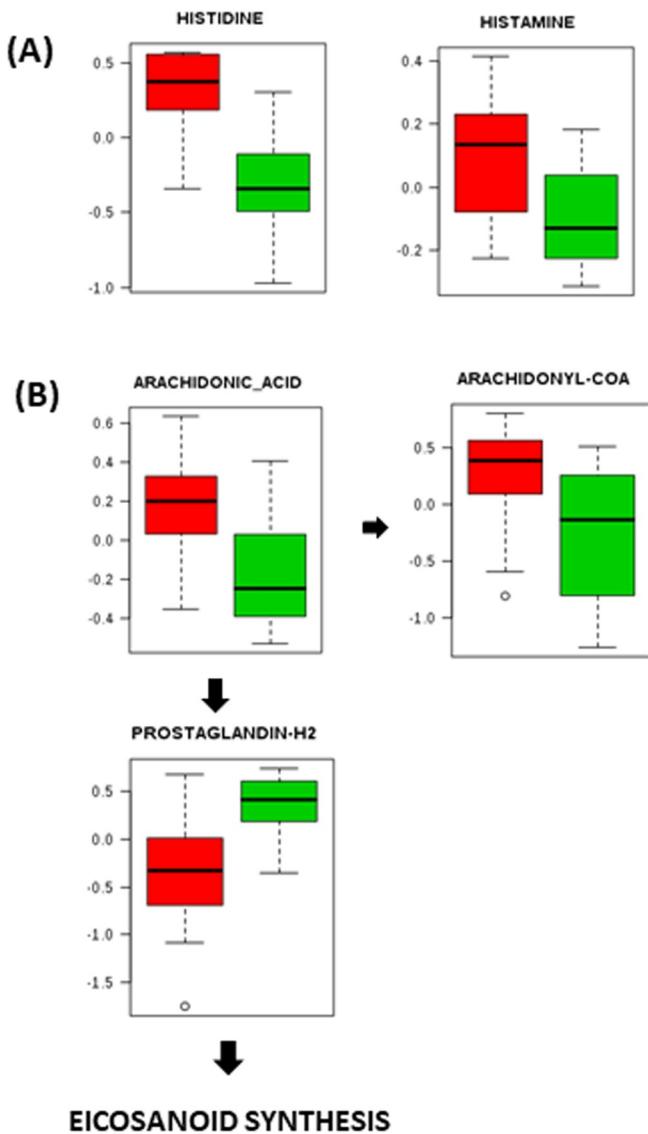

**Supplementary Figure S6:** Changes in tryptophan metabolism in lung SCC samples (red) versus paired histologically normal controls (green).

**Supplementary Figure S7:** Changes in urea cycle outputs in lung SCC samples (red) versus paired histologically normal controls (green). A possible link between arginine (ARG) and L-citrulline via the production of nitric oxide from nitric oxide synthase.

**Supplementary Figure S8:** Changes in thiol metabolism in lung SCC samples (red) versus paired histologically normal controls (green).

**Supplementary Figure S9:** Putative changes in metabolism in lung SCC samples (red) versus paired histologically normal controls (green) that could be linked to inflammatory events. **(A)** The synthesis of histamine from histidine is increased in SCC samples. **(B)** Increases in arachidonic acid do not correlate with increases in the eicosanoid intermediate prostaglandin H2 but with the formation of the archidonyl-CoA.

**Supplementary Table S1:** Positive ionization annotated compounds with their correspondent p.value, FDR and their expression.
