## Supplementary methods

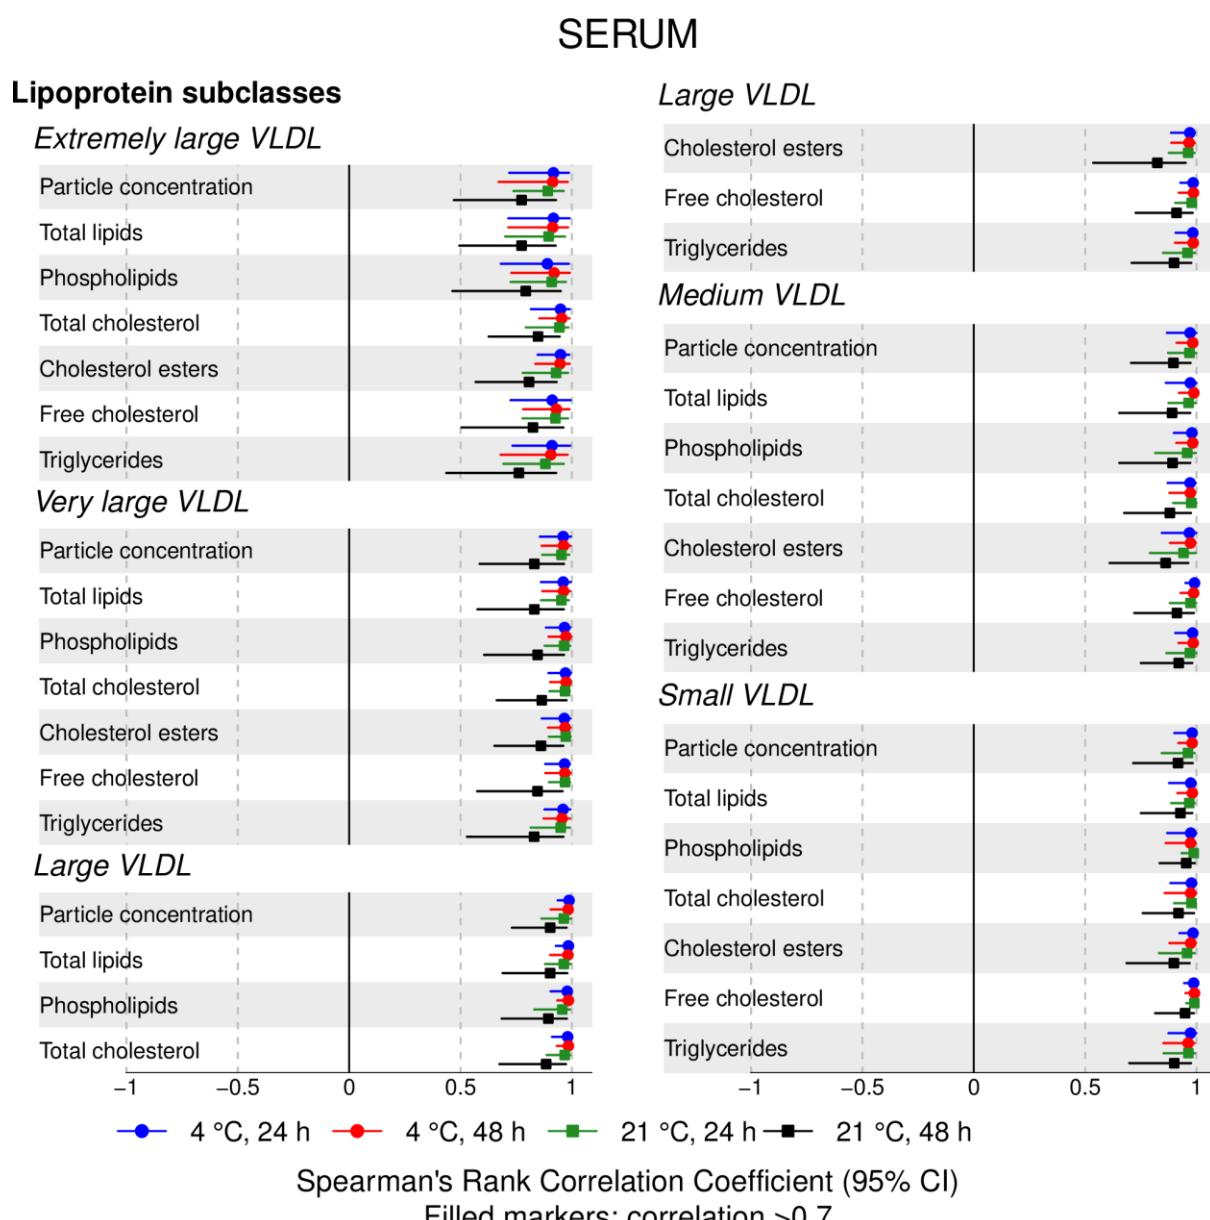

### *Text S1. Multiple testing correction: Principal component analysis (PCA) based Bonferroni correction*

Principal component analysis (PCA) was performed separately on each serum and plasma datasets and included samples subjected to reference and *pre-storage* variant conditions. In each dataset, all individuals who had data on all metabolic traits were used and PCA was performed on the z-scored metabolic data. This method assumes that the independence of the principal components (PCs) is equivalent to the number of independent testes of the original metabolic dataset, and that retaining a number of PCs that is enough to explain at least 95% of the variance will only result in a small chance of a type 1 error [1]. Since the number of variables available varies across serum and plasma datasets (151 and 148 metabolic traits, respectively) and both metabolomes are slightly different, the number of PCs needed to explain 95% of the variation in the metabolic traits also varies. The PCA results are as follows, serum, 8 PCs and plasma, 9 PCs. The highest number (9 PCs) was used as a conservative estimate of the number of independent tests been performed. Therefore, the threshold of *p*-value <0.05 becomes *p*-value <0.006 (i.e.  $\alpha/9$  where  $\alpha=0.05$ ), when multiple testing is considered, for assessing associations of up to 151 metabolic traits. Number of PCs obtained using only samples subjected to the reference conditions were very similar.

## Supplementary figures

**Figure S1.** Serum, pre-storage handling effects (Spearman's rank correlation): Spearman's rank correlation coefficients between lipoprotein particle and lipid concentration in reference samples ( $4\text{ }^{\circ}\text{C}$ , 1.5 h) and samples incubated at (i)  $4\text{ }^{\circ}\text{C}$ , 24 h; (ii)  $4\text{ }^{\circ}\text{C}$ , 48 h; (iii)  $21\text{ }^{\circ}\text{C}$ , 24 h; (iv)  $21\text{ }^{\circ}\text{C}$ , 48 h, before centrifugation (correlations for other metabolic traits are given in Figure 1–2). Spearman's rank correlation coefficients and 95% confidence intervals are listed in Tables S2.

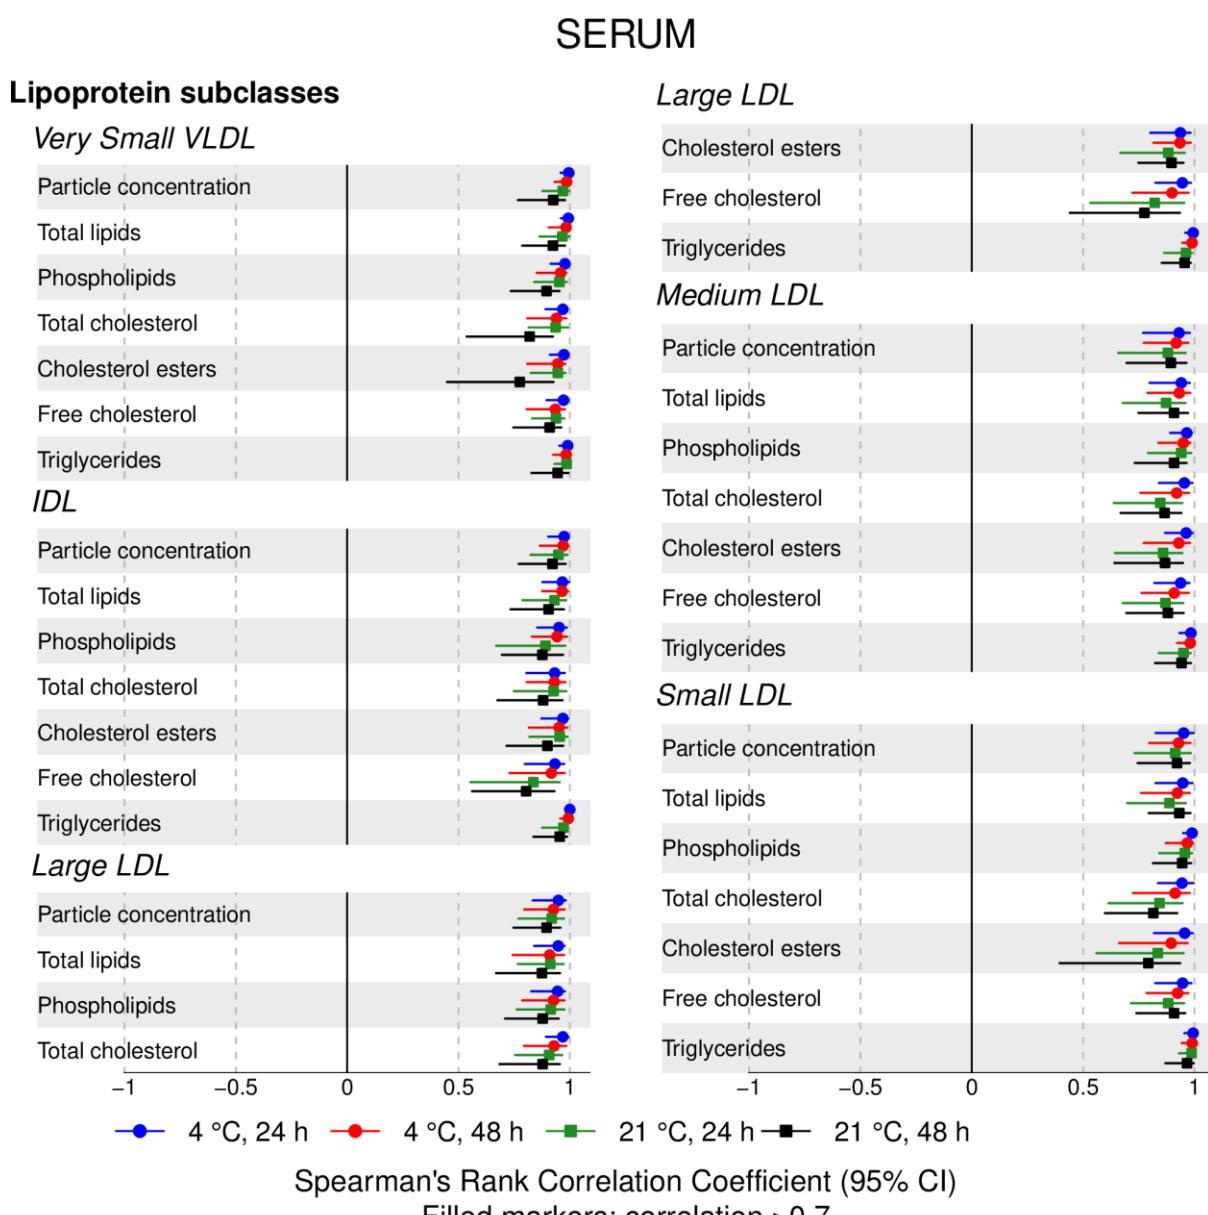

**Abbreviations:** VLDL=very-low-density lipoprotein.

**Figure S1 (continued).** Serum, pre-storage handling effects (Spearman's rank correlation): Spearman's rank correlation coefficients between lipoprotein particle and lipid concentration in reference samples ( $4\text{ }^{\circ}\text{C}$ , 1.5 h) and samples incubated at (i)  $4\text{ }^{\circ}\text{C}$ , 24 h; (ii)  $4\text{ }^{\circ}\text{C}$ , 48 h; (iii)  $21\text{ }^{\circ}\text{C}$ , 24 h; (iv)  $21\text{ }^{\circ}\text{C}$ , 48 h, before centrifugation (correlations for other metabolic traits are given in Figure 1-2). Spearman's rank correlation coefficients and 95% confidence intervals are listed in Tables S2.

**Figure S7-Principal Component Analysis (PCA) on serum non-lipid-related metabolic traits subjected to five different pre-storage conditions.** PCA was done on subsetted metabolic profiles which only includes the 19 (out of 151) non-lipid-related metabolic traits. Principal component (PC) 2 versus PC1. PCA is an exploratory method as it does not focus on finding differences between pre-storage conditions but to explain as much of the variation as possible of the metabolomic profiles with a few new variables (i.e. PCs). [A] **Correlation circle:** each metabolic trait is shown as a vector. For the displayed PCs [2], angles between metabolite vectors indicate their degree of correlation. Positively correlated metabolic traits are grouped together ( $\approx 0^\circ$  angle); negatively correlated ones are positioned on opposite sides of the plot origin ( $\approx 180^\circ$  degrees); a  $90^\circ$  angle between two metabolites indicate that they are uncorrelated. Dashed grey circles represent 100%, 50% and 25% explained variance of a metabolic trait by a PC. Metabolic traits, whose variance is explained by less than 50% by a PC are usually considered nonrelevant for that PC. [B] **Scores plot with ellipses enclosing samples from the same participant:** each participant is shown as a number and is represented by 5 data-points corresponding to each pre-storage condition; each pre-storage condition is colour coded. Clustering of samples indicates their compositional similarity for the metabolic traits described by the PCs displayed [2]. Samples from the same participant are enclosed by dotted lines. [C] **Scores plot with ellipses enclosing samples subjected to the same pre-storage conditions:** same as [B] but with samples subjected by the same pre-storage handling conditions enclosed by dotted lines. Ellipses are colour coded by pre-storage conditions.

**PCA on non-lipid-related metabolic traits:** PC1 and PC2, which explains 55.95 % of the total variance of the non-lipid-related metabolic traits (19 of the 151 metabolic traits), contains information of both, pre-storage conditions (PC1) and inter-individual differences (PC2). On PC1, from left to right, samples cluster according to increase in incubation temperature first and duration in second (sample clustering order: reference condition ( $4\text{ }^{\circ}\text{C}$ -1.5 h);  $4\text{ }^{\circ}\text{C}$ -24 h;  $4\text{ }^{\circ}\text{C}$ -48 h;  $21\text{ }^{\circ}\text{C}$ -24 h;  $21\text{ }^{\circ}\text{C}$ -48 h) illustrating the overall sample degradation signature. Moreover, from left (reference condition) to right ( $21\text{ }^{\circ}\text{C}$ -48 h), samples have progressive decreasing concentrations of glucose and higher concentrations of lactate, pyruvate, alanine, histidine, and phenylalanine. Glucose is inversely correlated ( $\approx 180^{\circ}$  angle) with lactate, pyruvate, histidine, phenylalanine and alanine. Moreover, the latter 4 metabolites are positively correlated amongst themselves ( $\approx 0^{\circ}$  angles). PC1 explains more than 50% of each of these 5 metabolites variance (i.e. correlation between PC1 scores and each metabolite is more than  $\pm 0.71$ ). No further clustering by pre-storage handling conditions at higher PC dimensions.

In plasma, the overall degradation fingerprint includes decrease in glucose and glutamine, alongside increased lactate and alanine (data not shown).

**PCA on the whole serum metabolic profiles** (i.e. the 151 lipid and non-lipid-related metabolic traits), did not differentiate samples by pre-storage conditions until PCs 4 and 5, which had strong contributions of glycolysis related metabolites and amino-acids (data not shown). In the scores plot of the first two PCs, samples clustered only according to participant, indicating that metabolic profile differences between participants were larger than metabolic concentration differences due to pre-storage conditions. Since Nightingale Health<sup>®</sup> NMR platform is mostly a lipidomic platform (only 13% of the metabolic traits are non-lipid-related) these traits are over represented in the metabolic profiles, and since these lipid-related traits are mostly robust to pre-storage conditions, the biggest variation in the whole metabolic profiles (and explained by the first few PCs) is associated with inter-individual differences and not differences induced by the pre-storage conditions (which only affects up to 9% of the metabolic traits).

**Abbreviations:** **ala**=alanine; **alb**=albumin; **ace**=acetate; **acace**=acetoacetate; **bohbut**=beta-hydroxybutyrate; **cit**=citrate; **crea**=creatinine; **glc**=glucose; **lac**=lactate; **pyr**=pyruvate; **gloI**=glycerol; **gln**=glutamine; **his**=histidine; **gly**=glycine; **ile**=isoleucine; **leu**=leucine; **val**=valine; **phe**=phenylalanine; **tyr**=tyrosine; **gp**=glycoprotein acetyls.

## Supplementary tables

**Table S1.** Characteristics of metabolic traits: metabolic traits concentration (or value) in serum and EDTA-plasma samples, subjected to the reference pre and post-storage conditions, from individuals who contributed to at least one pair of exposure-outcome analysis ( $n=37$ ). Pyruvate, glycerol and glycine are not quantified in Ethylenediaminetetraacetic acid (EDTA) - plasma samples due to the interfering resonances of EDTA on their signals.

**Table S2.** Spearman's correlation: serum, pre-storage handling effects. Spearman's rank correlation coefficients between metabolic trait concentrations (or values) in reference samples (condition: 4 °C, 1.5 h) and samples incubated at (i) 4 °C, 24 h; (ii) 4 °C, 48 h; (iii) 21 °C, 24 h; (iv) 21 °C, 48 h, before centrifugation (see Figures 1-2, S1).

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCI**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **PUFA**=polyunsaturated fatty acids; **UCI**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

**Table S3. Spearman's correlation: EDTA-plasma, pre-storage handling effects.** Spearman's rank correlation coefficients between metabolic concentrations (or values) in reference samples (condition: 4 °C, 1.5 h) and samples incubated at (i) 4 °C, 24 h; (ii) 4 °C, 48 h; (iii) 21 °C, 24 h; (iv) 21 °C, 48 h, before centrifugation (see Figures 3-4, S2). Pyruvate, glycerol and glycine are not quantified in EDTA-plasma samples due to the interfering resonances of EDTA on their signals. Abbreviations: C=cholesterol; IDL=intermediate-density lipoprotein; LCI=lower confidence interval; LDL=low-density lipoprotein; HDL=high-density lipoprotein; MUFA=monounsaturated fatty acids; PUFA=polyunsaturated fatty acids; UCI= upper confidence interval; VLDL=very-low-density lipoprotein.

**Table S4.** Spearman's correlation: serum, post-storage handling effects. Spearman's rank correlation coefficients between metabolic concentrations (or values) in reference conditions samples (i.e. no buffer addition delay or NMR analysis delay) and samples (i) left for 24 h before addition of sodium buffer followed by immediate NMR analysis (i.e. buffer delay); and (ii) addition of sodium buffer, then left for 24 h before NMR analysis (i.e. NMR delay); (see Figures 5-6, S3).

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCI**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **PUFA**=polyunsaturated fatty acids; **UCI**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

**Table S5. Spearman's correlation: EDTA-plasma, post-storage handling effects.** Spearman's rank correlation coefficients between metabolic concentrations (or values) in reference conditions samples (i.e. no buffer addition delay or NMR analysis delay) and samples (i) left for 24 h before addition of sodium buffer followed by immediate NMR analysis (i.e. buffer delay); and (ii) addition of sodium buffer, then left for 24 h before NMR analysis (i.e. NMR delay); (see Figures 7-8, S4). Pyruvate, glycerol and glycine are not quantified in EDTA-plasma samples due to the interfering resonances of EDTA on their signals.

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCI**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **PUFA**=polyunsaturated fatty acids; **UCI**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

Phenylalanine (mmol/l)	NMR delay	7.4e-01	4.8e-01	8.9e-01
Tyrosine (mmol/l)	Buffer delay	9.1e-01	7.4e-01	9.8e-01
Tyrosine (mmol/l)	NMR delay	9.6e-01	8.7e-01	9.9e-01

**Ketone bodies**

Acetate (mmol/l)	Buffer delay	8.3e-01	5.9e-01	9.5e-01
------------------	--------------	---------	---------	---------

Metabolic traits		conditions	correlation	LCI	UCI
Acetate (mmol/l)	NMR delay		9.0e-01	7.3e-01	9.7e-01
Beta-hydroxybutyrate (mmol/l)	Buffer delay		9.8e-01	9.2e-01	9.9e-01
Beta-hydroxybutyrate (mmol/l)	NMR delay		9.1e-01	7.2e-01	9.7e-01
Fluid balance					
Creatinine (mmol/l)	Buffer delay		9.7e-01	9.0e-01	9.9e-01
Creatinine (mmol/l)	NMR delay		9.3e-01	7.8e-01	9.7e-01
Albumin (signal area)	Buffer delay		9.0e-01	7.2e-01	9.7e-01
Albumin (signal area)	NMR delay		8.9e-01	7.5e-01	9.5e-01
Inflammation					
Glycoprotein acetyl (mmol/l)	Buffer delay		9.7e-01	8.6e-01	9.9e-01
Glycoprotein acetyl (mmol/l)	NMR delay		9.9e-01	9.6e-01	1.0e+00

**Table S6.** Serum, pre-storage handling effects (differences in mean levels): mean differences in metabolite concentrations (or trait value) per 24 h increment in incubation duration at 4 °C and 21 °C, for serum samples.

# Associations in Figure S5 are presented in SD-units. These SD point estimates can be obtained by dividing the point estimate (beta) in absolute (clinically meaningful) concentration by the metabolic trait standard deviation (SD), both provided in the below table.

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCl**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **N.obs**= number of observations (samples); **N.indiv**=number of individuals; **PUFA**=polyunsaturated fatty acids; **SD**=standard deviation; **UCl**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

**Table S7.** EDTA-Plasma, pre-storage handling effects (differences in mean levels): mean differences in metabolite concentrations (or trait value) per 24 h increment in incubation duration at 4 °C and 21 °C, for EDTA-samples samples. Pyruvate, glycerol and glycine are not quantified in EDTA-plasma samples due to the interfering resonances of EDTA on their signals. # Associations in Figure S5 are presented in SD-units. These SD point estimate can be obtained by dividing the point estimate in absolute (clinically meaningful) concentration by the metabolic trait standard deviation (SD), both provided in the below table.

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCI**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **N.obs**= number of observations (samples); **N.indiv**=number of individuals; **PUFA**=polyunsaturated fatty acids; **SD**=standard deviation; **UCI**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

**Table S8.** Serum, post-storage handling effects (differences in mean levels): mean differences in metabolite concentrations (or trait value) comparing 24 h delays in buffer addition (i.e. buffer delay) or NMR profiling (i.e. NMR delay) to the reference (no delays), for serum samples.

# Associations in Figure S6 are presented in SD-units. These SD point estimate can be obtained by dividing the point estimate (beta) in absolute (clinically meaningful) concentration by the metabolic trait standard deviation (SD), both provided in the below table.

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCI**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **N.obs**= number of observations (samples); **N.indiv**=number of individuals; **PUFA**=polyunsaturated fatty acids; **SD**=standard deviation; **UCI**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

**Table S9.** EDTA-plasma, post-storage handling effects (differences in mean levels): mean differences in metabolite concentrations (or trait value) comparing 24 h delays in buffer addition (i.e. Buffer delay) or NMR profiling (i.e. NMR delay) to the reference (no delays), for EDTA-plasma samples. Pyruvate, glycerol and glycine are not quantified in EDTA -plasma samples due to the interfering resonances of EDTA on their signals.

# Associations in Figure S6 are presented in SD-units. These SD point estimate can be obtained by dividing the point estimate (beta) in absolute (clinically meaningful) concentration by the metabolic trait standard deviation (SD), both provided in the below table.

**Abbreviations:** **C**=cholesterol; **IDL**=intermediate-density lipoprotein; **LCI**=lower confidence interval; **LDL**=low-density lipoprotein; **HDL**=high-density lipoprotein; **MUFA**=monounsaturated fatty acids; **N.obs**= number of observations (samples); **N.indiv**=number of individuals; **PUFA**=polyunsaturated fatty acids; **SD**=standard deviation; **UCI**= upper confidence interval; **VLDL**=very-low-density lipoprotein.

**Table S10. Literature table:** summary of previous studies assessing the effects of pre and post-storage handling conditions on serum or plasma metabolic traits also measured by Nightingale Health® NMR platform.

**Note 1:** Untargeted metabolomics (U), aims to measure as many metabolites as possible in a biological sample, without any requirement that the metabolites' identification be known beforehand. Quantification is given as relative concentrations. Targeted metabolomics (T), provides absolute concentration of a selected panel of metabolites. Semi-targeted metabolomics (S) provides absolute concentration using one calibration model to quantify multiple metabolites, instead of one quantification model per metabolite. Quantification is therefore less accurate than in targeted metabolomics.

**Note 2:** Studies using NMR have very similar metabolite coverage as the NMR platform used here. Untargeted studies due to its nature, i.e. the type of data (e.g. full spectra) and the statistical methods used (e.g. partial least squares- discriminate analysis), are more biased towards reporting non-robust metabolites. Therefore, for all untargeted NMR studies cited in Table S10, it is assumed that non-reported metabolites are stable. For example, Bernini et al. 2011, uses an untargeted NMR platform, that like the one used in this paper will detect isoleucine, since the authors did not report a change in this amino-acid, it is assumed that it is stable under the conditions they tested. However, in the table below we did not list all metabolic traits detected by the platform used in our study alongside references, that use NMR untargeted platform, which report stability of a metabolite by omission.

**Abbreviations:** CPMG=Carr-Purcell-Meiboom-Gill;  $^{13}\text{C}$ = Carbon-13; EDTA=Ethylenediaminetetraacetic acid; ESI= Electrospray ionization; FIA= Flow injection analysis; GC= Gas Chromatography;  $^1\text{H}$  NMR= Proton nuclear magnetic resonance; HDL= High density lipoprotein; HSQC=Heteronuclear Single Quantum Coherence; J-res=J-resolved; LC=Liquid Chromatography; LDL= Low density lipoprotein; MS= Mass Spectrometry; N= number of individuals; NMR= Nuclear Magnetic Resonance; NOESY=Nuclear Overhauser Effect Spectroscopy; RT=Room Temperature; STOCSY= Statistical Total Correlation Spectroscopy; SST= Serum-Separating Tube; 1D=one dimension.

\***Details of the metabolomics platforms:** Biocrates®= Biocrates® Life Sciences AG (Innsbruck, Austria), commercial suppliers of the AbsolutelQD™ commercial kits; ICL NPC= Imperial College London National Phenome Centre, laboratory of Jeremy Nicolson, John Lindon and colleagues; Nightingale Health®=commercial laboratory formerly known as Brainshake Inc. The same platform is also used by the Mika Ala-Korpela lab at the Biocentre Oulu platform (Finland).

† studies testing the effects of pre-analytical variation on a different pre-analytical phase e.g. studies testing post-centrifugation conditions during pre-storage (i.e. long-term freezing) sample handling, whilst we tested pre-centrifugation conditions during pre-storage handling.

<b>Ketone bodies</b>								
Acetat e	Jobard et al. 2016 [11]	Pre-storage: pre and <del>post</del> -centrifugation;	Serum, heparin-plasma; Fasting; Reference (pre-centrifugation):	Pre-centrifugation: 4°C, 22°C Post-centrifugation: 22°C	Pre-centrifugation: 1h (4°C), 6h (4°C, 22°C);	<sup>(1)H</sup> NMR (1D, CPMG, NOESY, <sup>(1)H-<sup>13</sup>C</sup> HSQC, STOCSY, J-res) / (U)	96	Pre-storage/pre-centrifugation: <b>decrease</b> at 22°C, 6h (but Variable Importance in Projection <1);

<b>Beta-hydroxybutyrate</b>			1h, 22°C; Reference (post- centrifugation): 15min		Post- centrifugation: 15min, 1h			<b>stable</b> at 4°C, 1 and 6h. Pre-storage/ <del>post</del> - centrifugation: <b>stable</b> .
	Current report	Pre-storage: pre- centrifugation; Post-storage: post- centrifugation;	Serum, potassium EDTA-plasma; Non-fasting; Reference, pre- storage: 1.5h, 4°C; Reference, post-storage: no sample or NMR analysis delay	Pre-storage/ pre- centrifugation: 4°C, 21°C Post-storage/ post- centrifugation: 4°C	Pre-storage/ pre- centrifugation: 1.5, 24, 48h Post-storage/ post- centrifugation: 0, 24h	( <sup>1</sup> H) NMR (1D, NOESY, CPMG), Nightingale Health* / (T)	Pre: 23 Post: 25	Pre-storage/pre- centrifugation: serum, mean <b>increase</b> up to 0.9SD; EDTA- plasma, mean <b>decrease</b> up to 0.9SD. Post-storage/post- centrifugation: mean <b>increase</b> up to 0.5SD.
	Jobard et al. 2016 [11]	Pre-storage: pre and <del>post</del> - centrifugation;	Serum, heparin- plasma; Fasting; Reference (pre- centrifugation): 1h, 22°C; Reference (post- centrifugation): 15min	Pre- centrifugation: 4°C, 22°C Post- centrifugation: 22°C	Pre- centrifugation: 1h (4°C), 6h (4°C, 22°C); Post- centrifugation: 15min, 1h	( <sup>1</sup> H) NMR (1D, CPMG, NOESY, ( <sup>1</sup> H- <sup>13</sup> C) HSQC, STOCSY, J-res) / (U)	96	Pre-storage/pre- centrifugation: <b>decrease</b> at 22°C, 6h (but Variable Importance in Projection <1); <b>stable</b> at 4°C, 1 and 6h. Pre-storage/ <del>post</del> - centrifugation: <b>stable</b> .
<b>Fluid Balance</b>								
<b>Creatinine</b>	Clark et al. 2003 [4]	Pre-storage: pre- centrifugation;	Potassium EDTA-plasma; Non-fasting; Reference: centrifuged immediately	4°C, 21°C	0, 1-4, 7 days	Clinical Chemistry / (T)	12	<b>Stable</b> at 4°C (mean percentage change less than 0.5% per day); <b>Increase</b> more than 5% per day at 21°C.
	Boyanton et al. 2002 [5]	Pre-storage: pre and <del>post</del> - centrifugation;	Serum, lithium heparin- plasma; Non- fasting; Reference: 0.5, 25°C	25°C	0.5, 4, 8, 16, 24, 32, 40, 48, 56h	Clinical Chemistry / (T)	10	Pre-storage/pre- centrifugation: <b>Increase</b> by 110% in plasma and 60% in serum after 24h (possibly due to interference of pseudo-creatinines in the assay). Pre-storage/ <del>post</del> - centrifugation: <b>stable</b> .
	Oddoze et al. 2012 [6]	Pre-storage: pre- centrifugation;	Serum, lithium heparin and fluoride plasma; Fasting status not specified;	4°C, 25°C	0, 2, 4, 6, 24h	Clinical Chemistry / (T)	10	<b>Stable</b> .

<b>Albumin</b>			Serum reference: 0.5h; Plasma reference: centrifuged immediately				
	Jobard et al. 2016 [11]	Pre-storage: pre and <u>post</u> -centrifugation;	Serum, heparin-plasma; Fasting; Reference (pre-centrifugation): 1h, 22°C; Reference (post-centrifugation): 15min	Pre-centrifugation: 4°C, 22°C Post-centrifugation: 22°C	Pre-centrifugation: 1h (4°C), 6h (4°C, 22°C); Post-centrifugation: 15min, 1h	( <sup>1</sup> H) NMR (1D, CPMG, NOESY, ( <sup>1</sup> H- <sup>13</sup> C) HSQC, STOCSY, J-res) / (U)	96
	<i>Current report</i>	<i>Pre-storage: pre-centrifugation; Post-storage: post-centrifugation;</i>	<i>Serum, potassium EDTA-plasma; Non-fasting; Reference, pre-storage: 1.5h, 4°C; Reference, post-storage: no sample or NMR analysis delay</i>	<i>Pre-storage/ pre-centrifugation: 4°C, 21°C Post-storage/ post-centrifugation: 4°C</i>	<i>Pre-storage/ pre-centrifugation: 1.5, 24, 48h Post-storage/ post-centrifugation: 0, 24h</i>	<i>(<sup>1</sup>H) NMR (1D, NOESY, CPMG), Nightingale Health* / (T)</i>	Pre:23 Post:25
<b>Albumin</b>	Clark et al. 2003 [4]	Pre-storage: pre-centrifugation;	Potassium EDTA-plasma; Non-fasting; Reference: centrifuged immediately	4°C, 21°C	0, 1-4, 7 days	Clinical Chemistry / (T)	12
	Boyanton et al. 2002 [5]	Pre-storage: pre and <u>post</u> -centrifugation;	Serum, lithium heparin-plasma; Non-fasting; Reference: 0.5, 25°C	25°C	0.5, 4, 8, 16, 24, 32, 40, 48, 56h	Clinical Chemistry / (T)	10
	Oddoze et al. 2012 [6]	Pre-storage: pre-centrifugation;	Serum, lithium heparin and fluoride plasma; Fasting status not specified; Serum reference: 0.5h; Plasma reference: centrifuged immediately	4°C, 25°C	0, 2, 4, 6, 24h	Clinical Chemistry / (T)	10
	Bernini et al. 2011[7]	Pre-storage: pre and <u>post</u> -centrifugation;	Serum (SST), potassium EDTA-plasma; Fasting status not specified; Reference: centrifuged immediately (for serum after 30 min) and frozen immediately	Pre-centrifugation: 4°C, 25°C Post-centrifugation: 25°C	Pre-centrifugation: 0-4h Post-centrifugation: 0, 6, 12, 24h	( <sup>1</sup> H) NMR (1D, NOESY CPMG) / (U)	Pre:6 Post:5
	<i>Current report</i>	<i>Pre-storage: pre-centrifugation; Post-storage: post-centrifugation;</i>	<i>Serum, potassium EDTA-plasma; Non-fasting;</i>	<i>Pre-storage/ pre-centrifugation: 4°C, 21°C</i>	<i>Pre-storage/ pre-centrifugation: 1.5, 24, 48h</i>	<i>(<sup>1</sup>H) NMR (1D, NOESY, CPMG), Nightingale Health* / (T)</i>	Pre:23 Post:25

			<i>Reference, pre-storage: 1.5h, 4°C; Reference, post-storage: no sample or NMR analysis delay</i>	<i>Post-storage/ post-centrifugation: 4°C</i>	<i>Post-storage/ post-centrifugation: 0, 24h</i>			<i>Post-storage/post-centrifugation: stable.</i>
