Supplementary Methods

Protocol for transformation of the recombinant vector into *Agrobacterium tumefaciens*

EHA101/GV3101/EHA105/EHA105 (pSoup):

Thaw the chemically competent cells on ice.

Gently mix the thawed cells with the recombinant vector using a pipette.

Sequentially incubate the mixture on ice for 10 min, in liquid nitrogen for 5 min, in a 37°C water bath for 30 s, and on ice for another 10 min.

Add 700 µL of antibiotic-free Luria-Bertani (LB) liquid medium to the mixture and shake the culture at 28°C for 2–3 h.

Centrifuge the culture at 6000 rpm for 1 min to pellet the bacteria.

Retain about 100 µL of the supernatant and use it to gently resuspend the bacterial pellet.

Spread the resuspended bacterial cells onto LB agar plates containing the appropriate antibiotic.

Invert the plates and incubate at 28°C for 2–3 days.

Protocol for transformation into the yeast strain EGY48:

Thaw 100 µL of EGY48 competent cells on ice.

Add pre-chilled plasmids to the cells, followed by 10 µL Carrier DNA. Heat the mixture at 95–100°C for 5 min, then place in an ice bath.

Repeat the heating and chilling steps once then add 500 µL of PEG/LiAc and gently mix by pipetting.

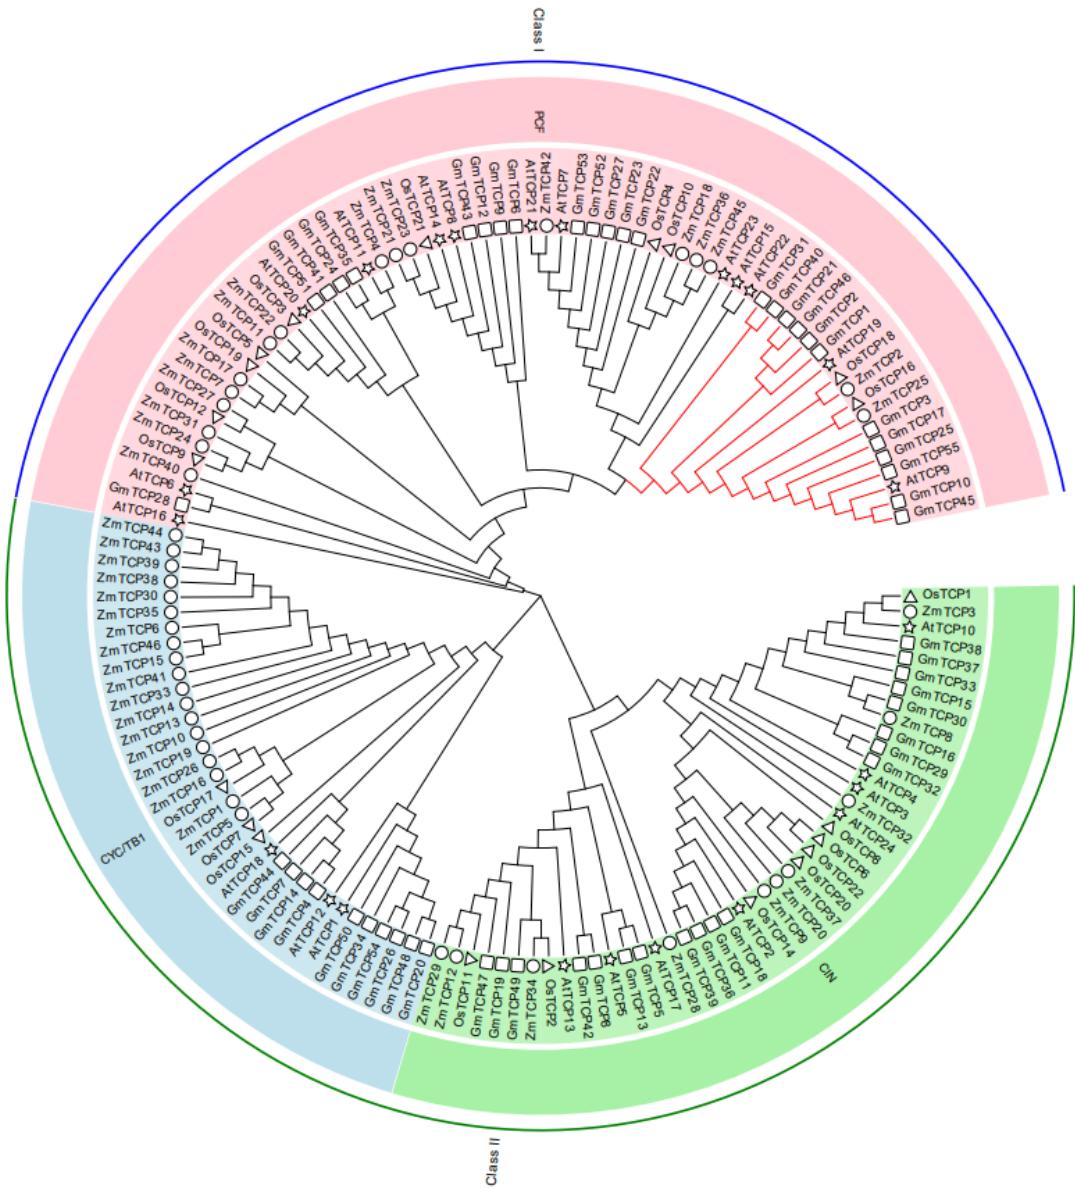

Incubate the mixture in a water bath at 30°C for 30 min (inverting the tube 6–8 times every 15 min).

Place the tube in a 42 °C water bath for 15 min (inverting 6–8 times every 7.5 min).

Centrifuge at 5000 rpm for 40 s and discard the supernatant.

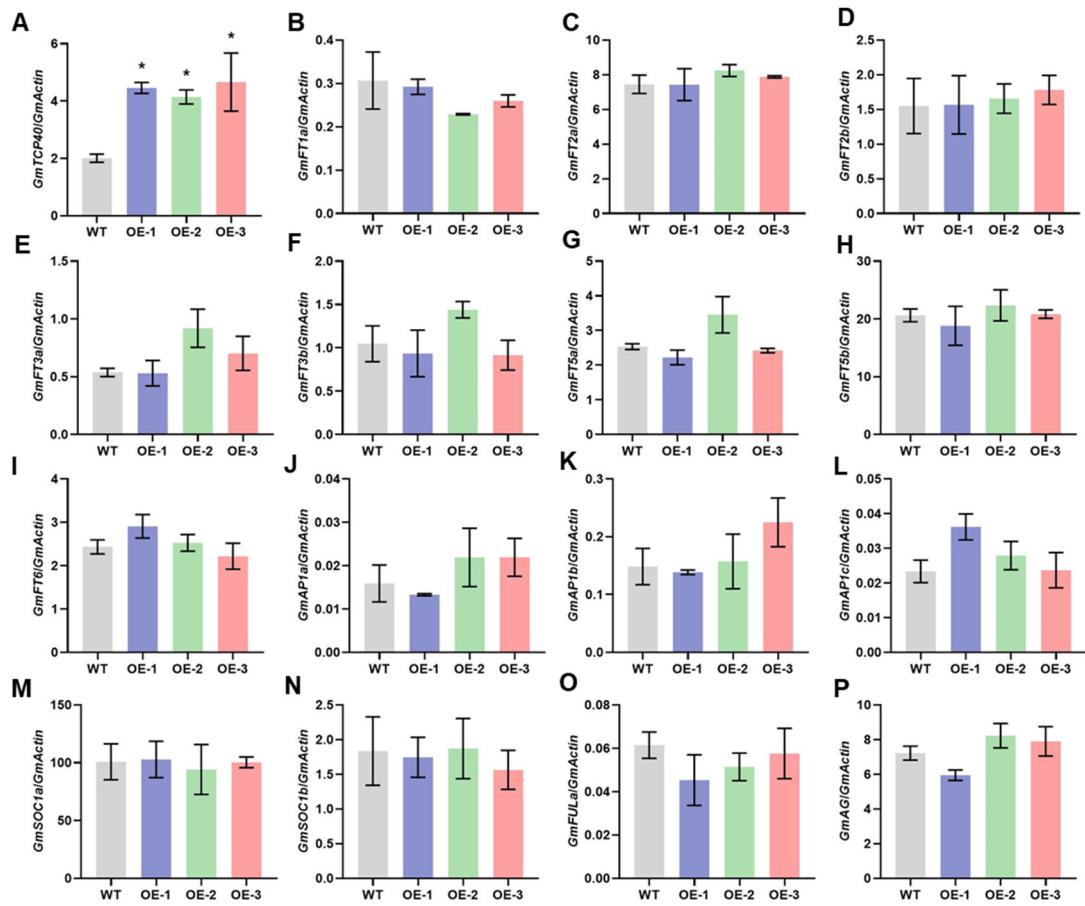

Resuspend the cells in 400 µL of ddH₂O and centrifuge for 30 s before discarding the supernatant.

Resuspend the cells in 50 µL of ddH₂O, spread onto SD/-Trp/-Ura plates, and incubate at 30°C for 3–5 days.

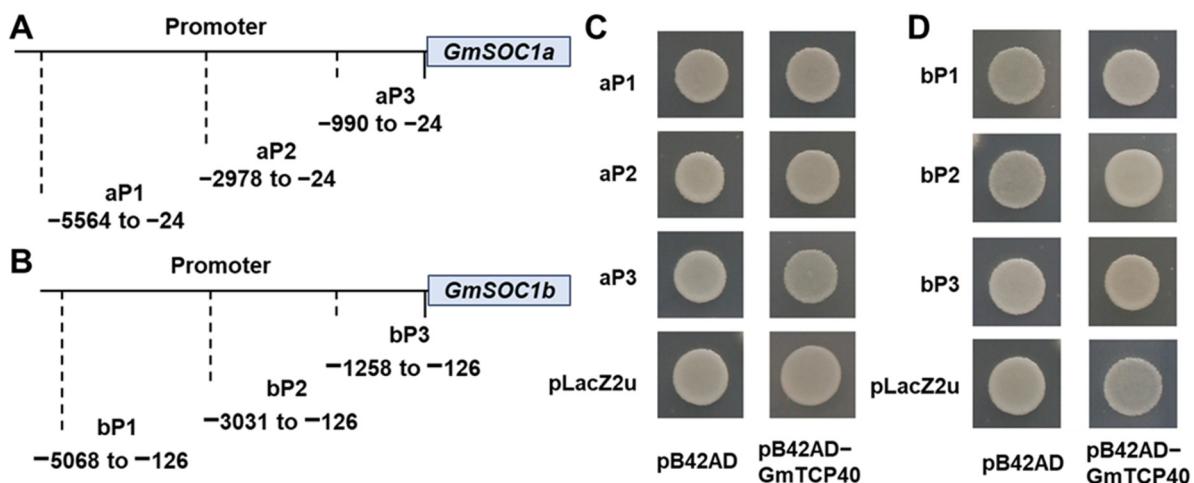

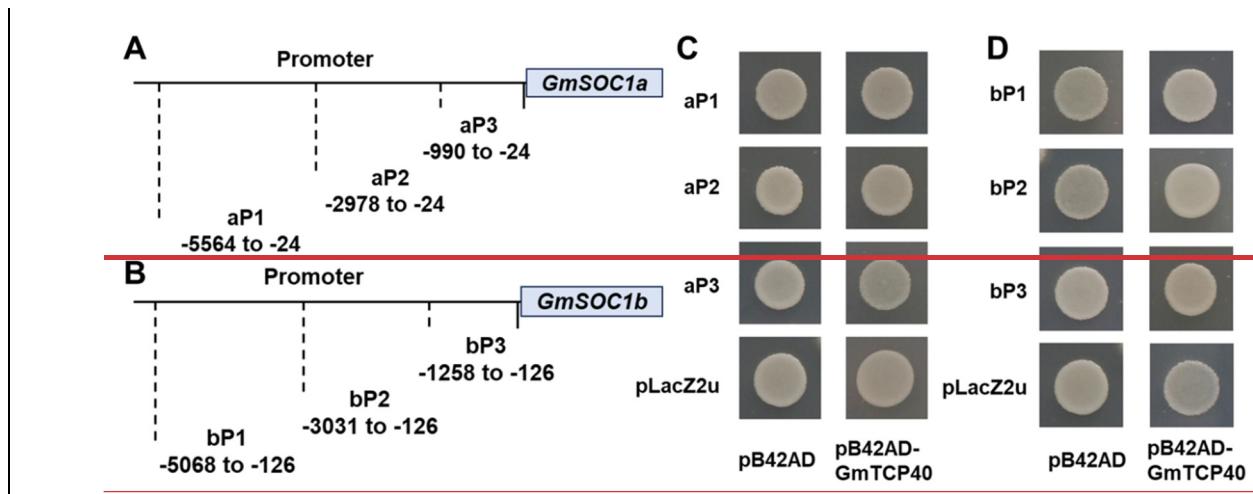

Supplementary Figure S1. Phylogenetic analysis of TCP homologs from four different plant species.

Phylogenetic relationships of the TCP proteins from *Arabidopsis thaliana*, *Oryza sativa*, *Zea mays*, and *Glycine max*. The phylogenetic tree was constructed using the neighbor-joining (NJ) method with a bootstrap value of 1000 in MEGA 7 software. The red branch signifies the specific location of GmTCP40 within the branch.

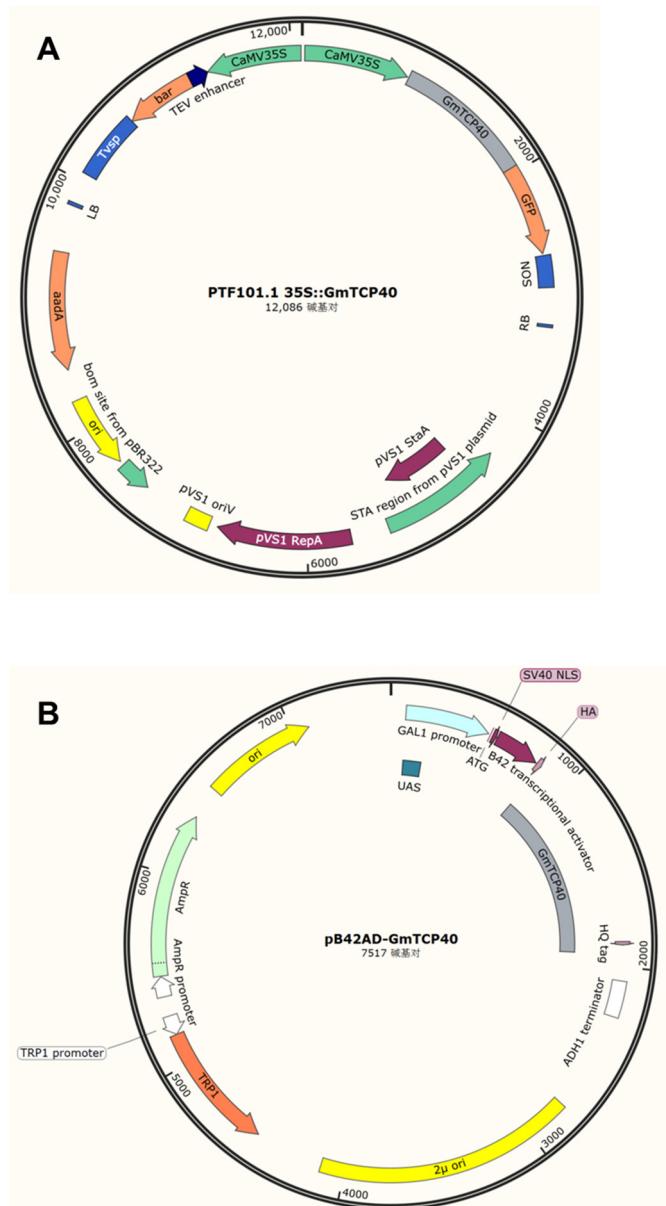

Supplementary Figure S2. Expression levels of flowering-related genes in WT plants and *GmTCP40*-OE transgenic lines under short-day conditions (A-P). The leaves of three *GmTCP40* overexpression lines (OE-1, OE-2, and OE-3) and wild type (WT) plants under short-day (SD) (12 h light/12 h dark) conditions were harvested for qRT-PCR analysis of the expression levels of *GmTCP40* (A), *GmFT1a* (B), *GmFT2a* (C), *GmFT2b* (D), *GmFT3a* (E), *GmFT3b* (F), *GmFT5a* (G), *GmFT5b* (H), *GmFT6* (I), *GmAP1a* (J), *GmAP1b* (K), *GmAP1c* (L), *GmSOC1a* (M), *GmSOC1b* (N), *GmFULa* (O), and *GmAG* (P). The relative expression level was normalized to that of *GmActin*. The data are presented as means \pm SD of three replicates (* $p < 0.05$).

Supplementary Figure S3. GmTCP40 does not bind to promoters of *GmSOC1a* and *GmSOC1b*. (A-B)

fragments of the promoter of *GmSOC1a* and *GmSOC1b* were subcloned into pLacZ2u vector, respectively.

(C-D) The interaction between GmTCP40 and the *GmSOC1a* and *GmSOC1b* promoter was examined by yeast one-hybrid (Y1H) assay. The transformants were assessed on SD/-Trp/-Ura media supplemented with 20 mM X-gal, Galactose (Gal), and Raffinose (Raf). Empty vectors served as the negative controls.

Supplementary Figure S4. Diagrams of pTF101-GmTCP40 and pB42AD-GmTCP40 vector. (A) A diagram of the Vector pTF101-GmTCP40. (B) A diagram of the Vector pB42AD-GmTCP40.

Supplementary Table S1. Source information of 175 re-sequenced soybean varieties.
