SUPPLEMENTARY MATERIAL

Table S1. Summary of mineralogical and elemental composition and main physico-hydraulic and chemical properties of MMS-1 and LHS-1 simulants, horse/swine monogastric manure, and mixtures of MMS-1 or LHS-1 simulants and manure (simulant/manure rates: 100:0, 90:10, 70:30, 50:50; w/w %)

	MMS-1	LHS-1	Horse/swine monogastric manure
Mineralogical composition	Plagioclase, amorphous minerals and zeolite (main), hematite and smectite (secondary)	Plagioclase and amorphous minerals (main), kaolinite and chlorite (secondary)	
Elemental composition	Si, Al, Fe, Ca, Mg, K, Na, P and Mn (macroelements), Ni, Cr, V, Zn, Cu and Pb (microelements)	Si, Al, Ca, Fe, Na, Mg, K, P, Mn and S (macroelements), Ni, Cr, V, Cu, Zn and Pb (microelements)	C, Ca, N, S, P, Fe, Mg, Na, Al, and Mn (macroelements), Zn, Cu, Cr, Pb, V and Ni (microelements)
Physico-hydraulic properties	Coarse textured substrate with high macroporosity and low water holding capacity	Coarse textured substrate with high macroporosity and low water holding capacity	Porous medium with high water holding capacity
Chemical properties	Alkaline pH (8.9), low EC and CEC, source of bioavailable Ca, Mg and K, low bioavailability of PTE	Alkaline pH (9.7), very low EC and CEC, source of bioavailable Ca, medium-low bioavailability of PTE	Alkaline pH (9.0), high EC and CEC, source of bioavailable K, Ca, Mg, N, P, Fe, S and Mn, medium-low bioavailability of PTE
MMS-1/manure mixtures (main properties)	Alkaline pH (8.9-9.0), low-to-high EC ($0.3\text{--}3.3 \text{ dS m}^{-1}$), CEC ($8\text{--}23 \text{ cmol+ kg}^{-1}$) and bioavailability of plant nutrients. Enhanced physico-hydraulic properties with increasing rates of manure in the mixture up to 30% in weight, then they got worst in the 50:50 w:w mixture. MMS-1/manure mixtures are better than LHS-1/manure ones in terms of chemical fertility (lower pHs and higher nutrient availability); this divergent fertility was particularly evident at 90:10 w:w rate and tended to be mitigated by increasing the levels of manure		
LHS-1/manure mixtures (main properties)	Alkaline pH (9.3-9.7), low-to-high EC ($0.1\text{--}3.7 \text{ dS m}^{-1}$), CEC ($1\text{--}22 \text{ cmol+ kg}^{-1}$) and bioavailability of plant nutrients. Enhanced physico-hydraulic properties with increasing rates of manure in the mixture up to 30% in weight, then they got worst in the 50:50 w:w mixture. LHS-1/manure mixtures are better than MMS-1/manure ones in terms of water retention, especially in the 'dry' region of matrix potential head (between -100 and -600 cm)		

The mineralogical and elemental compositions of two simulants were assessed by X-ray powder diffraction (XRPD), wavelength- and energy-dispersive X-ray fluorescence (WD- and ED-XRF), respectively. The elemental profile of horse/swine monogastric manure was determined by CHNS elemental analyser and inductively coupled plasma - optical emission spectrometry (ICP-OES), after acid digestion in a microwave-assisted digestion system. Physico-hydraulic and chemical properties were assessed according to internationally harmonised and standardised analytical protocols for characterisation of soil/substrate samples. EC indicates electrical conductivity, CEC: cation exchange capacity and PTE: potentially toxic elements.

Table S2. Concentration (mg kg^{-1} DW) of main macro and micronutrients in different mixtures of MMS-1 or LHS-1 simulants and manure (simulant/manure rates: 100:0, 90:10, 70:30, 50:50; w/w %), separated in rhizo and bulk soil after lettuce growth, extracted by 0.05M EDTA at pH 7 (n=3).
