Abbreviations refer to Figure 1.

Table S2. Correlation of high factor load indicators under different treatments.

Treatments	F3	C7	F7		
	PC3	PC3	PC4	PC2	PC4
	NO ₃ -N	AP	pH	AK	pH
NH ₄ ⁺ -N	0.93**	DOC 0.94**	NO ₃ -N 0.80**	AP 0.99**	NH ₄ ⁺ -N 0.71**

Note: C3 treatments PC3 and PC4 both have only one high factor loading indicator and therefore were placed directly into the MDS. Abbreviations refer to Figure 1.

The PC1 high-weight metric correlations (Table S1) showed that SOM under the F3 treatment had the largest sum of correlation coefficients and was therefore selected into MDS. The high weight indicator MBC/MBN in PC2 had the largest correlation coefficient sum and was therefore selected into the MDS. In PC3, the correlation coefficients of NH₄⁺-N and NO₃-N were r>0.60 (Table S2), and NO₃-N was selected into the MDS because it had a high factor loading. PC4 had only one high weight indicator C/N, so C/N was selected into the MDS. As a result, the MDS indicators for soil quality evaluation under F3 treatment were SOM, MBC/MBN, NO₃-N and C/N

Table S3. Weights of TDS evaluation indicators of paddy soil under different treatments.

Soil indicators	F3		C3		C7		F7
