Plotted solid black line represents the real concentration of the analyte and symbols represent each addition of the respective interferent and its perceived effect on the analyte concentration.

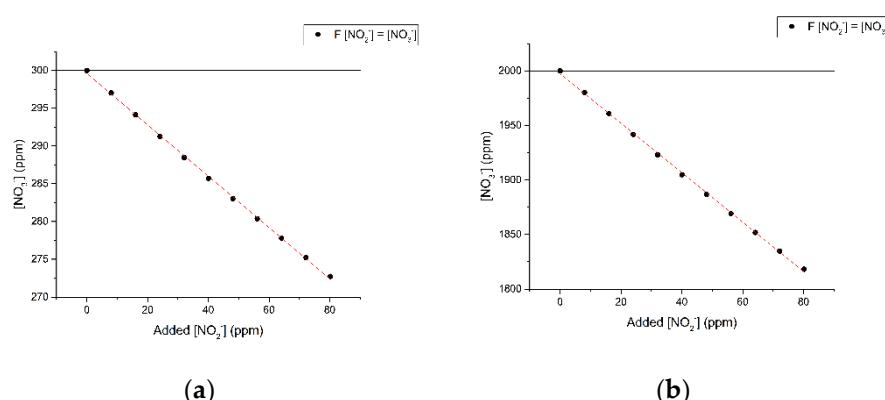

Figure 1. Tests A1 and A2: nitrite interference in a (a) low nitrate concentration sample, $[NO_3^-] = 300$ ppm; and in a (b) high concentration sample, $[NO_3^-] = 2000$ ppm. Each increment of nitrite represents ≈ 8 ppm.

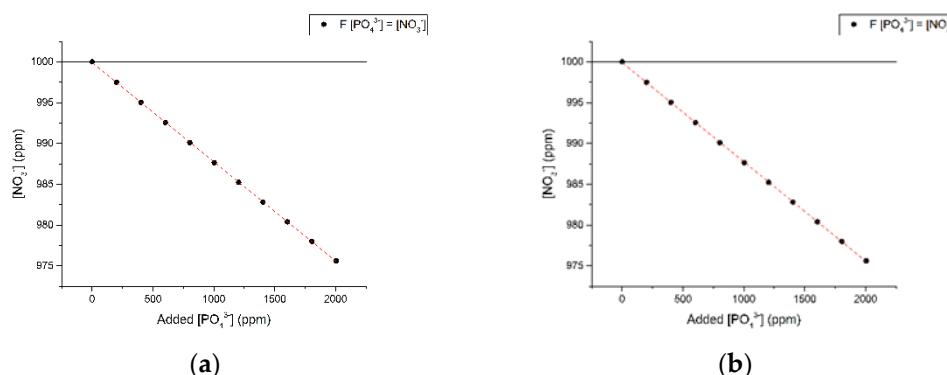

Figure 2. Tests B1 and B2: phosphate interference in a (a) nitrate sample, $[NO_3^-] = 1000$ ppm; and a (b) nitrate/nitrite sample, $[NO_3^-] = [NO_2^-] = 1000$ ppm. Each increment of PO_4^{3-} represents ≈ 200 ppm.

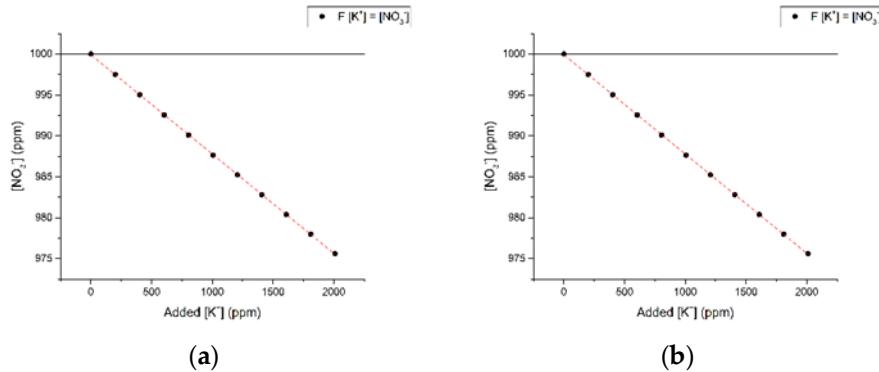

Figure 3. Tests C1 and C2: potassium interference in a (a) nitrate sample, $[NO_3^-] = 1000$ ppm; and a (b) nitrate/nitrite sample, $[NO_3^-] = [NO_2^-] = 1000$ ppm. Each increment of K^+ represents ≈ 200 ppm.

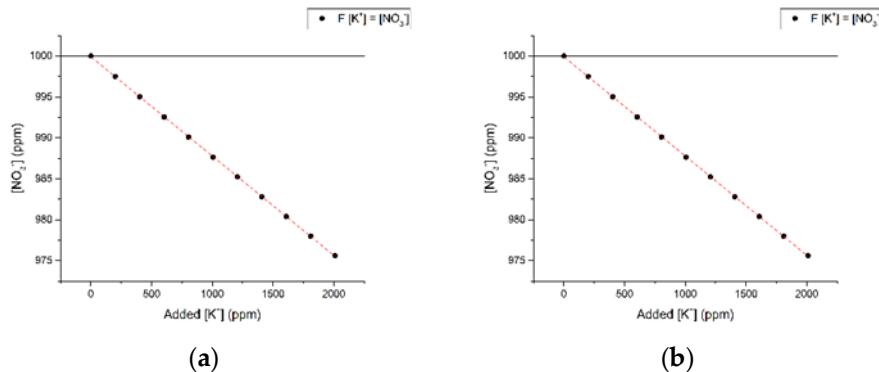

Figure 4. Tests D1 and D2: phosphate and potassium (1:1) mixture interference in a (a) nitrate sample, $[NO_3^-] = 1000$ ppm; and a (b) nitrate/nitrite sample, $[NO_3^-]=[NO_2^-] = 1000$ ppm. Each increment of PO_4^{3-}/K^+ mixture represents 1250–1260 ppm.

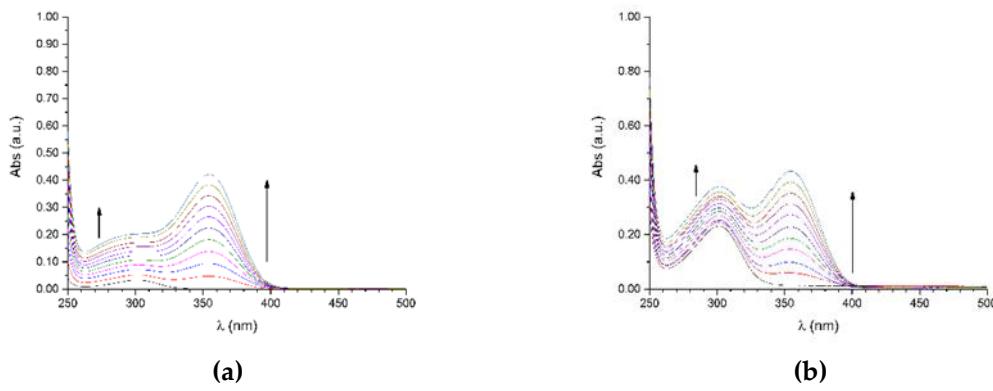

Figure 5. Acquired spectra for (a) Tests A1 and (b) Test A2.

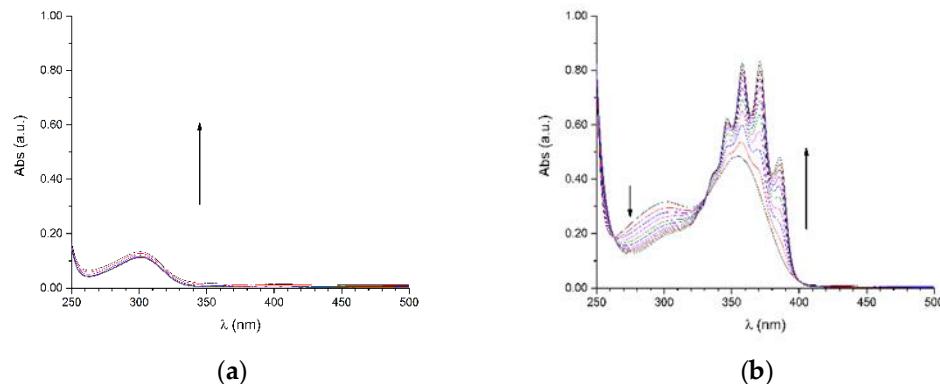

Figure S6. Acquired spectra for (a) Tests B1 and (b) Test B2.

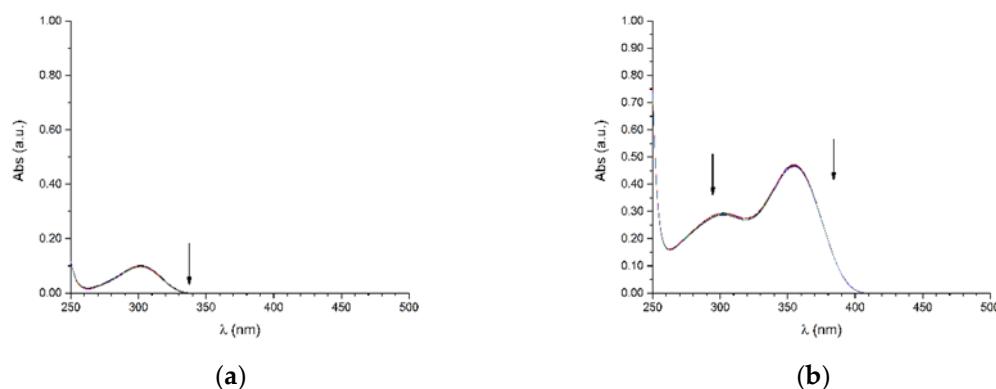

Figure 7. Acquired spectra for (a) Tests C1 and (b) Test C2.

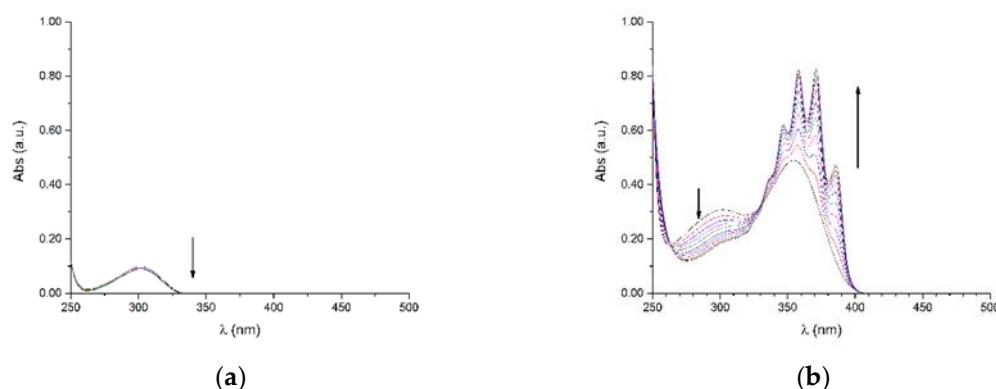

Figure 8. Acquired spectra for (a) Tests D1 and (b) Test D2.
