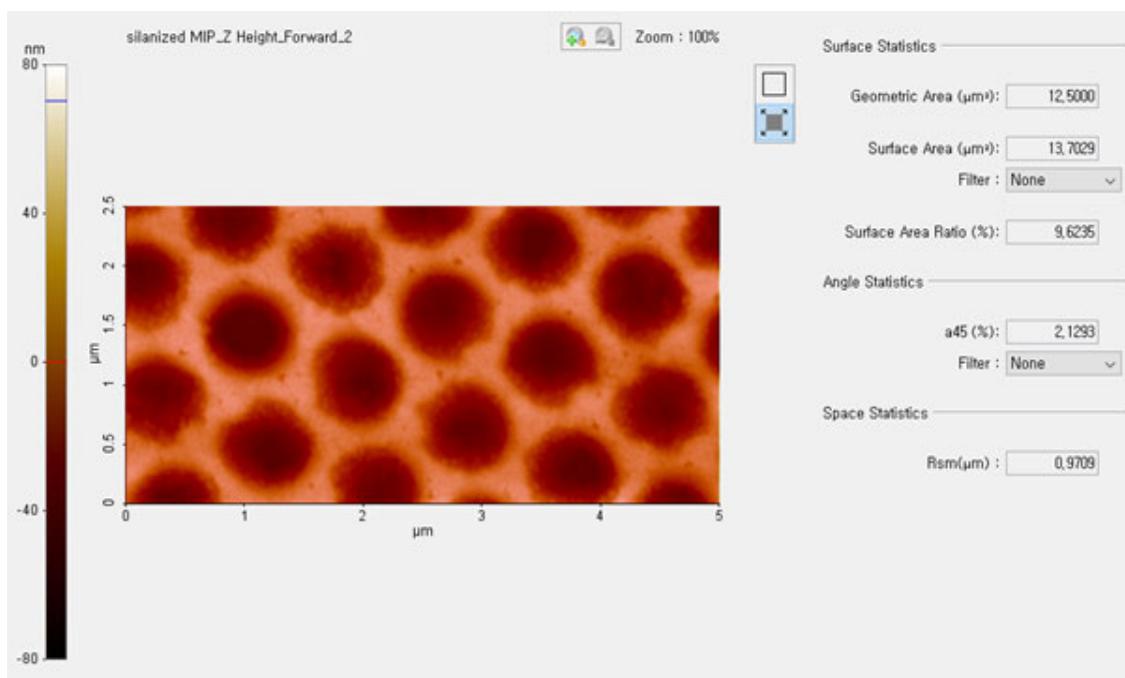

Figure S1. Surface analysis of the *st*-MIP film. The patterned surface area ($13.7029 \mu\text{m}^2$) on the scanned area ($12.5 \mu\text{m}^2$) indicates an increased aspect ratio of 1.096 (A/A_0) on the defined area.

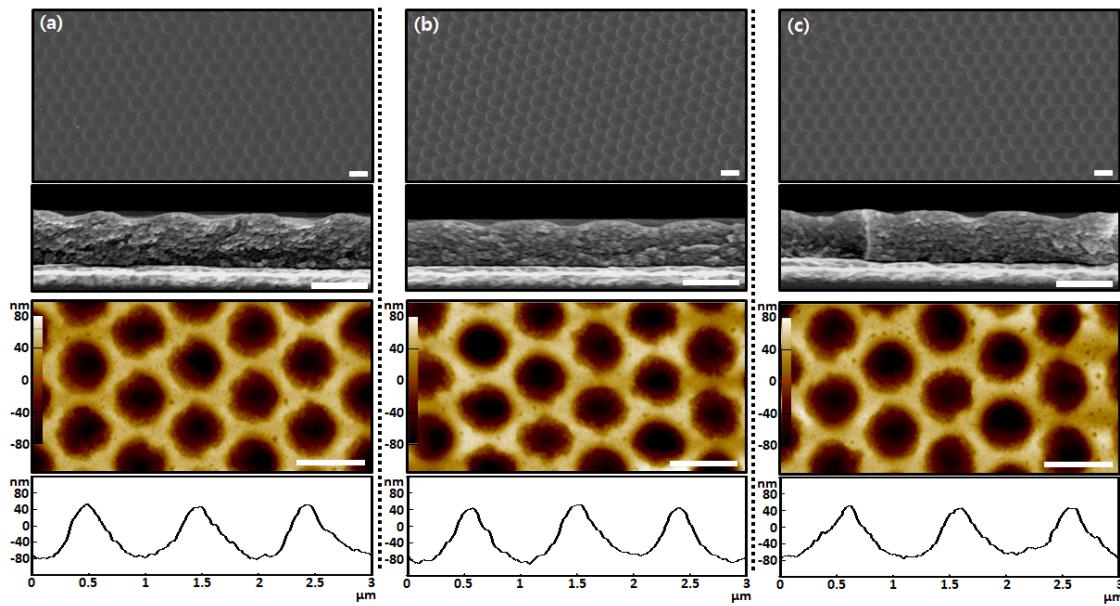

Figure S2. SEM (lower: cross-sectional image) and AFM images (line profilometry is included below the AFM image) of the (a) *st*-NIP, (b) *n*-MIP, and (c) *n*-NIP films. All the scale bars are 1 μm .

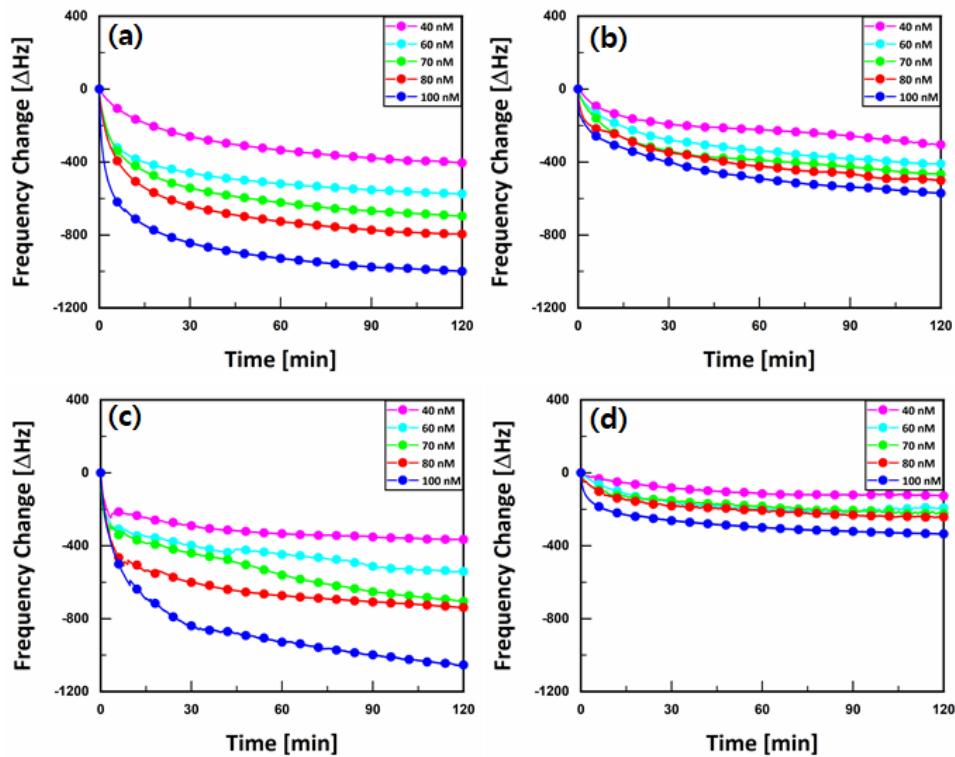

Figure S3. Frequency change as a function of time on the (a) *n*-MIP, (b) *n*-NIP, (c) *st*-MIP, and (d) *st*-NIP films in a variety of 2,4-D concentrations (40–100 nM) for a 2-h rebinding process.

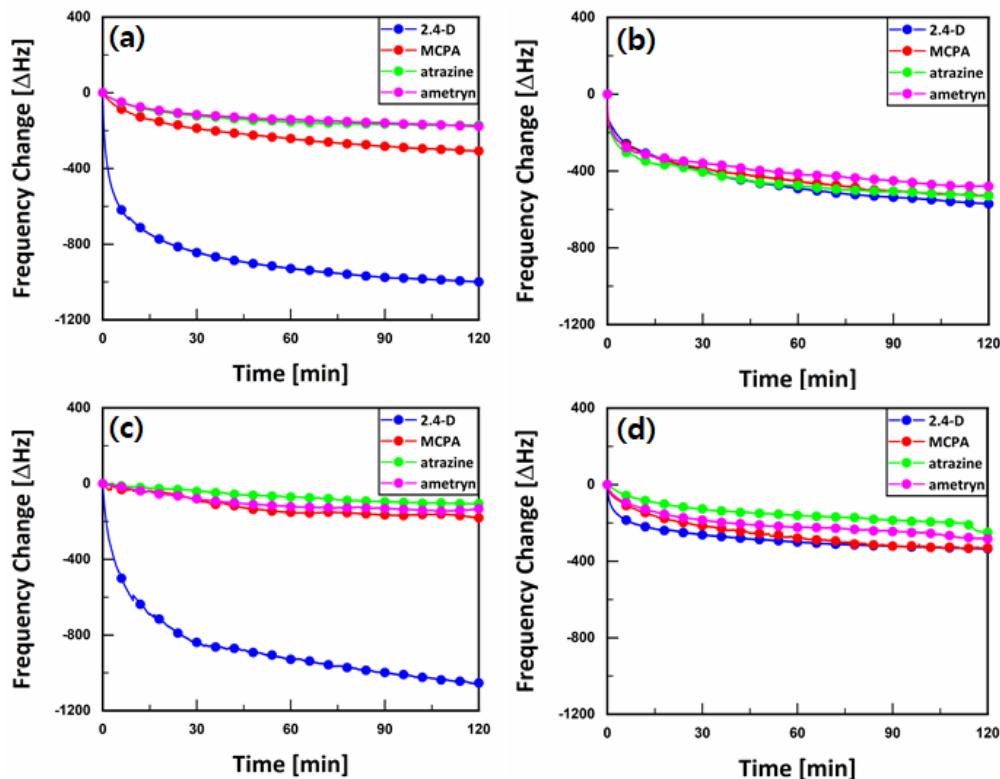

Figure S4. Frequency change as a function of time on the (a) *n*-MIP, (b) *n*-NIP, (c) *st*-MIP, and (d) *st*-NIP films in each analogous herbicide solution (namely, 2,4-D, MCPA, atrazine, or ametryn) with a fixed concentration (100 nM) for the 2-h rebinding process.

Table S1. Adsorbed mass, template-free polymer weight, and Q_e values on the *st*-MIP/NIP and *n*-MIP/NIP films.
