II. X-ray Crystal Structure

Single crystals of the compounds **1** and **2** were mounted on a Kapton loop using a Paratone N oil. An APEX II CCD BRUKER detector and a graphite Mo- $K\alpha$ monochromator were used for the data acquisition. All measurements were done at 150 K and a refinement method was used for solving the structure. The structure resolution was accomplished using the SHELXT-2014 [26] program and the refinement was done with the SHELXL-2014/7 [27] program. The structure solution and the refinement were achieved with the PLATON software [28]. Finally, ORTEP of the compounds were obtained using the MERCURY software [29]. During the refinement steps, all atoms- except hydrogens- were refined anisotropically. The position of the hydrogens was determined using residual electronic densities which are calculated by a Fourier difference. Finally, in order to obtain a complete refinement, a weighting step followed by multiples loops of refinement was done. Details on crystal data and structure refinements are summarized in Table S1 in the supplementary materials. CIF files are deposited at the Cambridge Data Base Centre under the reference CCDC numbers 1852482–1852483.
