**Figure S1.** UV-Vis absorbance of unmodified gelatin and Gelatin-Ph. Notice the peak at 275 nm corresponding to the Ph group.

**Figure S2.** (a) Scanning electron microscope (SEM) observation of the cross-section of Gelatin-Ph hydrogel. (b) Pore size of the Gelatin-Ph hydrogel obtained through different air containing H<sub>2</sub>O<sub>2</sub> exposure times. Bar: S.E. (*n* = 40).

**Figure S3.** Intensity-time curve of the Gelatin-Ph exposed with air containing  $\text{H}_2\text{O}_2$  for 0–60 min.

**Figure S4.** Confocal laser-scanning microscope observation of the C2C12 myoblasts on the culture well plate (control) and Gelatin-Ph hydrogel obtained through exposure to air containing  $\text{H}_2\text{O}_2$  for 15, 30, 45 and 60 min. Cells were observed by staining with Calcein-AM on day 2 of culture.

**Figure S5.** Stress-strain curve of Gelatin-Ph hydrogel fabricated by exposing solution containing 3.0% w/v Gelatin-Ph and  $1 \text{ U mL}^{-1}$  HRP with air containing  $\text{H}_2\text{O}_2$  for 15, 30, 45 and 60 min.
