	45	0,750	0,942	0,838

\* F-test with 1 and 16 degrees of freedom (DF) of the numerator and denominator of the F statistic, respectively. Nominal significance values (p-values) inferior to 0.10 (in red) indicate a significant difference between treatments in the respective measurement times and height above the mixture application point.

**Table S3.** The mean concentration (n=3 plants) of the studied pesticides and respective standard errors in the treatments pressurized (P) and non-pressurized (NP) at 50 and 100 cm above the application point for each measurement time.

**Figure S1** - Results of PCA based on sets of variables related to the pesticide's mixture applied to coconut palm trees via pressurized or non-pressurized endotherapy, namely: concentrations of carbofuran, 3-OH-carbofuran, ciproconazole, difenoconazole, imidacloprid, thiabendazole, thiamethoxam, and spirodiclofen (A, B, and C) or, considering the mixture variables; the plant variables, as the number of bunches, leaves, length and stem thickness (D). The PCAs (Dimensions (Dim) 1 and 2) highlight groups formed by different heights (50 or 100 cm) above the mixture injection point, (A) sampled times (2, 15, 30, or 45 days) (B), or endotherapeutic treatments (pressurized or nonpressurized) (C and D).
