## List of Figures

<b>Figure S1</b>	FE-SEM image of (a) pure Si nanoparticles. (b) FT-IR result comparing pure Si nanoparticles and Si–OH after piranha solution pre-treatment.	5
<b>Figure S2</b>	(a) Formation of siloxane networks from piranha-treated Si–OH using APTES. (b) Hydrolysis and (c) condensation reaction mechanism of TEOS showing formation of siloxane bridges.	5
<b>Figure S3</b>	XPS survey scan of TEOS–SiO <sub>2</sub> @Si and APTES/TEOS–SiO <sub>2</sub> @Si precursors.	6
<b>Figure S4</b>	XRD patterns of (a) Si and (b) TEOS-derived SiO <sub>2</sub> @Si and APTES/TEOS-derived SiO <sub>2</sub> @Si.	6
<b>Figure S5</b>	XRD reference peaks for face-centered cubic Si crystal (Reference code 98-065-2265)	7
<b>Figure S6</b>	TEM images showing carbon crosslinking from PEI and PDA carbon coating efficiency in (a, b) composite samples prepared via traditional SiO <sub>2</sub> sol-gel synthesis reaction and carbon coating at room temperature and (c, d) composite samples prepared via hydrothermal treatment at 140 °C for 24 h.	8
<b>Figure S7</b>	XPS survey spectra of PVP–SiO <sub>2</sub> @Si and Si nanoparticles.	9
<b>Figure S8</b>	XPS survey spectra core shell PDA–PEI@SiO <sub>2</sub> @Si and yolk shell PDA–PEI@SiO <sub>2</sub> @Si composite samples.	10
<b>Figure S9</b>	Illustration of the two possible reaction mechanisms showing the formation of PDA–PEI carbon crosslinks.	11
<b>Figure S10</b>	XPS survey spectra core shell PDA@SiO <sub>2</sub> @Si and yolk shell PDA–PEI@PVP–SiO <sub>2</sub> @Si composite samples.	12
<b>Figure S11</b>	Raman peak fitting of core shell PDA@SiO <sub>2</sub> @Si composite sample.	13
<b>Figure S12</b>	Raman peak fitting of yolk shell PDA–PEI@SiO <sub>2</sub> @Si composite sample.	13
<b>Figure S13</b>	Raman peak fitting of yolk shell PDA–PEI@PVP–SiO <sub>2</sub> @Si composite sample.	14

<b>Figure S14</b>	Raman peak fitting of core shell PDA-PEI@SiO <sub>2</sub> @Si composite sample.	14
<b>Figure S15</b>	CV scans of core shell PDA-PEI@TEOS-SiO <sub>2</sub> @Si composite fabricated via RT using TEOS as precursor solution.	15
<b>Figure S16</b>	Galvanostatic charge and discharge profiles of core shell PDA@SiO <sub>2</sub> @Si (a), core shell PDA-PEI@SiO <sub>2</sub> @Si (b), core shell PDA-PEI@PVP-SiO <sub>2</sub> @Si (c), and yolk shell PDA-PEI@SiO <sub>2</sub> @Si (d) composite samples.	15
<b>Figure S17</b>	Representative SEM images showing the surface morphology of particles in (a, b) yolk shell PDA-PEI@PVP-SiO <sub>2</sub> @Si, (c, d) yolk shell PDA-PEI@SiO <sub>2</sub> @Si, (e, f) core shell PDA-PEI@PVP-SiO <sub>2</sub> @Si, (g, h) core shell PDA-PEI@SiO <sub>2</sub> @Si, and (i, j) core shell PDA@SiO <sub>2</sub> @Si anode (a, c, e, g, i) before and (b, d, f, h, j) after 200 lithiation/delithiation cycles at 1 A g <sup>-1</sup> current density.	16

## List of Tables

<b>Table S1</b>	The $I_D/I_G$ values of the samples calculated by the ratio of the D band peak area to the G band peak area using Gaussian–Lorentzian curve fitting model.	17
<b>Table S2</b>	The porous structure of the representative composite samples described by BJH model of BET analysis.	18

**Figure S1.** FE-SEM image of (a) pure Si nanoparticles. (b) FT-IR result comparing pure Si nanoparticles and Si-OH after piranha solution pre-treatment.

**Figure S2.** (a) Formation of siloxane networks from piranha-treated Si-OH using APTES. (b) Hydrolysis and (c) condensation reaction mechanism of TEOS showing formation of siloxane bridges.

### Hydrolysis Reaction:

APTES reacts with water, leading to the hydrolysis of the ethoxysilane groups. This results in the formation of hydroxyl-modified APTES and ethanol. The presence of hydroxyl groups on APTES is crucial for subsequent condensation reactions.

### Condensation:

Hydroxyl-modified APTES undergoes condensation reactions, forming siloxane bonds on the silica surface. This step contributes to the growth of the silica network.

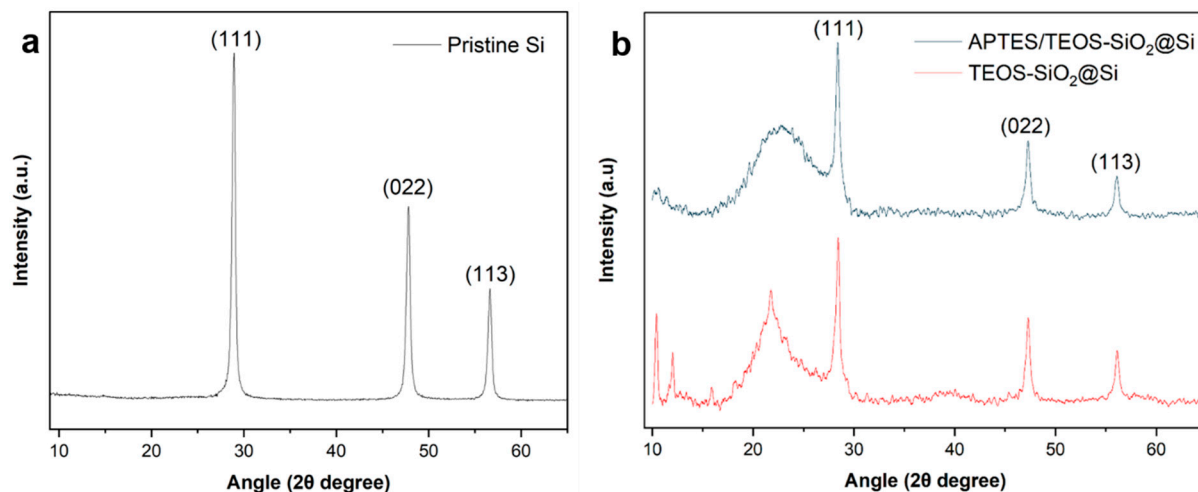

### Self-catalysis:

Siloxane bonds formed on the silica surface can undergo self-catalysis. In this process, water molecules react with the siloxane bonds, regenerating hydroxyl groups on the silica surface and releasing a hydroxyl-modified APTES.

This self-catalysis step contributes to the continual growth of the silica nanoparticles and ensures the presence of hydroxyl groups on the surface.

**Figure S3.** XPS survey scan of TEOS-SiO<sub>2</sub>@Si and APTES/TEOS-SiO<sub>2</sub>@Si precursors.

**Figure S4.** XRD patterns of (a) Si and (b) TEOS-derived SiO<sub>2</sub>@Si and APTES/TEOS-derived SiO<sub>2</sub>@Si.

**Figure S5.** XRD reference peaks for face-centered cubic Si crystal (Reference code 98-065-2265)

### Peak list

No.	$h$	$k$	$l$	$d$ [Å]	$2\theta$ [deg]	$I$ [%]
1	1	1	1	3.13559	28.442	100.0
2	0	2	2	1.92015	47.302	65.0
3	1	1	3	1.63751	56.122	37.8
4	2	2	2	1.56779	58.856	0.0
5	0	0	4	1.35775	69.129	9.8
6	1	3	3	1.24596	76.375	14.4
7	2	2	4	1.10860	88.029	19.9

**Figure S6.** TEM images showing carbon crosslinking from PEI and PDA carbon coating efficiency in (a, b) composite samples prepared via traditional  $\text{SiO}_2$  sol-gel synthesis reaction and carbon coating at room temperature and (c, d) composite samples prepared via hydrothermal treatment at 140 °C for 24 h.

**Figure S7.** XPS survey spectra of PVP-SiO<sub>2</sub>@Si and Si nanoparticles.

**Figure S8.** XPS survey spectra core shell PDA-PEI@SiO<sub>2</sub>@Si and yolk shell PDA-PEI@SiO<sub>2</sub>@Si composite samples.
