Message from the Guest Editor

Smart Wings are seen as a key factor to improve aircraft performance, increase passenger comfort beyond the state-of-the-art. As today's transport aircraft have unquestionably reached a high level of quality, a combination of innovative techniques is required to obtain that ambitious goal. Various approaches for flow control promise a reduction of induced drag, e.g. by cruise-point dependent adaptation of the lift distribution, and of friction drag, e.g. by laminar flow. Passive load control methods like aeroelastic tailoring, and active load control techniques, in combination with new sensors like LIDAR systems or sensor networks, will help to reduce structural wing mass. New aircraft and wing design processes will capture the potential of the technologies for performance increase and load reduction, and will assess the impact on drag, aircraft mass and thus fuel burn reduction. Promising technologies will be tested in wind tunnel experiments, in UAV and full aircraft scale, making use of innovative sensing and data acquisition techniques.

an Open Access Journal by MDPI

Editor-in-Chief

Message from the Editor-in-Chief

You are welcome to contribute a research article or a comprehensive review for consideration and publication in *Aerospace* (ISSN 2226-4310), an on-line, open access journal.

Aerospace adheres to rigorous peer-review as well as editorial processes and publishes high quality manuscripts that address both the fundamentals and applications of aeronautics and astronautics. Our goal is to enable rapid dissemination of high impact works to the scientific community.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility: indexed within [Scopus](#), [SCIE \(Web of Science\)](#), [Inspec](#), and [other databases](#).

Journal Rank: JCR - Q2 (*Engineering, Aerospace*) / CiteScore - Q2 (*Aerospace Engineering*)
